

## ANNEX A

## Measuring Agricultural Support

### 1. Definitions of OECD indicators of agricultural support

#### Nominal indicators used in this report\*

**Producer Support Estimate (PSE):** the annual monetary value of gross transfers from consumers and taxpayers to agricultural producers, measured at the farm gate level, arising from policy measures that support agriculture, regardless of their nature, objectives or impacts on farm production or income. It includes market price support, budgetary payments and budget revenue foregone, i.e. gross transfers from consumers and taxpayers to agricultural producers arising from policy measures based on: current output, input use, area planted/animal numbers/receipts/incomes (current, non-current), and non-commodity criteria.

**Market Price Support (MPS):** the annual monetary value of gross transfers from consumers and taxpayers to agricultural producers arising from policy measures that create a gap between domestic market prices and border prices of a specific agricultural commodity, measured at the farm gate level. MPS is also available by commodity.

**Producer Single Commodity Transfers (producer SCT):** the annual monetary value of gross transfers from consumers and taxpayers to agricultural producers, measured at the farm gate level, arising from policies linked to the production of a single commodity such that the producer must produce the designated commodity in order to receive the payment. This includes broader policies where transfers are specified on a per-commodity basis. Producer SCT is also available by commodity.

**Consumer Single Commodity Transfers (consumer SCT):** the annual monetary value of gross transfers from (to) consumers of agricultural commodities, measured at the farm gate level, arising from policies linked to the production of a single commodity. Consumer SCT is also available by commodity.

**Consumer Support Estimate (CSE):** the annual monetary value of gross transfers from (to) consumers of agricultural commodities, measured at the farm gate level, arising from policy measures that support agriculture, regardless of their nature, objectives or impacts on consumption of farm products. If negative, the CSE measures the burden (implicit tax)

\* Only indicators actually used in this report are defined here. Additional indicators, mainly relating to commodity specificity, are defined in the "PSE Manual" (OECD's *Producer Support Estimate and Related Indicators of Agricultural Support: Concepts, Calculation, Interpretation and Use*, available on the website [www.oecd.org/tad/support/psecse](http://www.oecd.org/tad/support/psecse)).

on consumers through market price support (higher prices), that more than offsets consumer subsidies that lower prices to consumers.

**General Services Support Estimate (GSSE):** the annual monetary value of gross transfers to general services provided to agricultural producers collectively (such as research, development, training, inspection, marketing and promotion), arising from policy measures that support agriculture regardless of their nature, objectives and impacts on farm production, income, or consumption. The GSSE does not include any payments to individual producers.

**Total Support Estimate (TSE):** the annual monetary value of all gross transfers from taxpayers and consumers arising from policy measures that support agriculture, net of the associated budgetary receipts, regardless of their objectives and impacts on farm production and income, or consumption of farm products.

### Ratio indicators and percentage indicators

**Percentage PSE (%PSE):** PSE transfers as a share of gross farm receipts (including support in the denominator).

**Percentage SCT (%SCT):** is the commodity SCT expressed as a share of gross farm receipts for the specific commodity (including support in the denominator).

**Share of SCT in total PSE (%):** share of Single Commodity Transfers in the total PSE. This indicator is also calculated by commodity.

**Producer Nominal Protection Coefficient (producer NPC):** the ratio between the average price received by producers (at farm gate), including payments per tonne of current output, and the border price (measured at farm gate). The Producer NPC is also available by commodity.

**Producer Nominal Assistance Coefficient (producer NAC):** the ratio between the value of gross farm receipts including support and gross farm receipts (at farm gate) valued at border prices (measured at farm gate).

**Percentage CSE (%CSE):** CSE transfers as a share of consumption expenditure on agricultural commodities (at farm gate prices), net of taxpayer transfers to consumers. The %CSE measures the implicit tax (or subsidy, if CSE is positive) placed on consumers by agricultural price policies.

**Consumer Nominal Protection Coefficient (consumer NPC):** the ratio between the average price paid by consumers (at farm gate) and the border price (measured at farm gate). The Consumer NPC is also available by commodity.

**Consumer Nominal Assistance Coefficient (consumer NAC):** the ratio between the value of consumption expenditure on agricultural commodities (at farm gate) and that valued at border prices.

**Percentage TSE (%TSE):** TSE transfers as a percentage of GDP.

**Percentage GSSE (%GSSE):** share of expenditures on general services in the Total Support Estimate (TSE).

## 2. The PSE classification

### Introduction

Each year since the mid-1980s the OECD has measured the monetary transfers (support) associated with agricultural policies in OECD countries (and increasingly, in non-OECD

countries), using a standard method. For this purpose the OECD has developed several indicators of transfers, the most important and central one being the Producer Support Estimate (PSE). The results, published annually by the OECD, are the only available source of internationally comparable and transparent information on support levels in agriculture. The support estimates have provided an important contribution to the international policy dialogue on agriculture and trade.

Over the years, while the fundamental methodology to measure support has not changed, policy measures have evolved. This has been partially reflected in the component parts of the overall PSE, which are categorised to improve the evaluation of policy reform and for use in policy analysis. With the further evolution of policies, following a two-year period of discussion among experts, OECD countries decided to adopt significant changes in the classification of the generic policy categories in the PSE, to change the measure of support to commodities, and to improve the presentation of the relevant indicators. These changes reflect the evolution of agricultural policies in OECD countries and were incorporated for the first time into the 2007 report on *Agricultural Policies in OECD Countries: Monitoring and Evaluation*. This annex chapter explains the new PSE classification, and how the data and indicators can be used to monitor policy developments.

### **Measuring agricultural support**

The Producer Support Estimate (PSE) estimates the annual monetary transfers to farmers from three broad categories of policy measures that:

- Maintain domestic prices for farm goods at levels higher (and occasionally lower) than those at the country's border (market price support [MPS] estimation).
- Provide payments to farmers based on, for example, the quantity of a commodity produced, the amount of inputs used, the number of animals kept, the area farmed, an historical (fixed) reference period, or farmers' revenue or income (budgetary payments).
- Provide implicit budgetary support through tax or fee reductions that lower farm input costs, for example for investment credit, energy, and water (budgetary revenue foregone estimation).

A crucial point to emphasise is that support not only comprises budget payments that appear in government accounts (which is often the popular understanding of support), but also estimations of budgetary revenues foregone, and estimation of the gap between domestic and world market prices for farm goods – market price support.

The PSE indicators are expressed in both absolute monetary terms (in national currencies, in US dollars and in euros) and in relative terms – in the case of the %PSE as a percentage of the value of gross farm receipts (including support payments) in each country for which the estimates are made. The %PSE shows the degree to which farmers are supported in a way that is not influenced by the sectoral structure and inflation rate of the country concerned, making this estimate the most widely acceptable and useful indicator for comparisons of support across countries and time.

Additional indicators are derived from the PSE, such as the Producer Nominal Assistance Coefficient (producer NAC) and the Producer Nominal Protection Coefficient (producer NPC). The producer NAC is expressed as a ratio between the value of gross farm receipts (including all forms of measured support) and the gross farm receipts valued at border prices (without support). The producer NPC is defined as a ratio between the average price received by the

producers (including payments based on current output) and the border price. The complete set of OECD indicators of support is described in Annex A.1.

The main purpose of the calculations is to show the estimates and composition of support each year, and to compare the trends across countries and through time, in order to monitor and evaluate the extent to which OECD countries are making progress in policy reform to which all OECD governments are committed. The PSE data (various indicators of support) are also used as inputs in models used by the OECD (PEM, GTAP, SAPIM) to analyse the effects of different policy instruments on production, trade, farm incomes and the environment.

### **Changes in the PSE methodology implemented in 2007**

In its work on monitoring and evaluating agricultural policy developments, the OECD has always not only estimated the overall level of support, but also shown how that support was composed of different categories of agricultural policy measures. The classification of support into the different categories under the PSE is based on how policies are actually implemented – and not on the objectives or impacts of those policies. Changes in the composition of support have over time become an increasingly important element in assessing progress towards reforming agricultural policies. Yet, as the nature of agricultural policies continues to evolve, the policy categories used for classifying support may have to adjust as well. This is why the nature of the policy categories shown under the PSE has now been revised, as described in the following. It should be noted that the number and definition of policy categories under the PSE, and hence the breakdown of support according to its composition, is the only change to the PSE methodology that has been made – the overall PSE level is not affected by that change.

#### **Previous classification of PSE and related indicators**

The PSE classification that was used before 2007 (including the 2006 report on *Agricultural Policies in OECD Countries: At a Glance* and the previous report on *Agricultural Policies in Non-OECD Countries: Monitoring and Evaluation*, published in 2007 but prepared in 2006) is shown in Box A.1.

#### **New classification of PSE and related indicators**

In recent years in the process of policy reform, policies in many OECD countries have been moving – to different degrees and at different speeds – towards providing support that is less dependent on producing specific commodities. Policies are also increasingly providing support based on farm area or on historical (fixed) criteria, which may be land, animal numbers, or income, for example. In some cases, production is required (but the actual commodities produced – currently or in the past – are not specified), in other cases no agricultural commodity production is required or support is provided for the production of non-commodity outputs. In many cases, there are other criteria that farmers must also meet in order to be entitled to support, such as implementing constraints on the use of inputs, or leaving land idle from commodity production but kept in “good agricultural or environmental condition”.

The thrust of many of the changes in policies has been to move in the direction of decoupling support from specific commodity production, and to base support on other criteria. While there is increasingly more flexibility in what farmers can produce in order to be entitled to support, there is often less flexibility in how farmers manage their operations, with greater regulatory constraints or conditions. The consequence is that

**Box A.1. Classification of PSE and related support indicators  
applied until 2006**

**Producer Support Estimate (PSE) (A-H)**

- A. Market price support estimation of which MPS commodities
  - B. Payments based on output
  - C. Payments based on area planted/animal numbers
  - D. Payments based on historical entitlements
  - E. Payments based on input use
  - F. Payments based on input constraints
  - G. Payments based on overall farm income
  - H. Miscellaneous payments
- Percentage PSE (PSE as a % of gross farm receipts)  
 Producer Nominal Protection Coefficient (NPC)  
 Producer Nominal Assistance Coefficient (NAC)

**General Services Support Estimate (GSSE)**

**Consumer Support Estimate (CSE)**

*Transfers to producers from consumers*

*Other transfers from consumers*

*Transfers to consumers from taxpayers*

*Excess feed costs*

Percentage CSE (CSE as a % of farm gate value of consumption)

Consumer NPC

Consumer NAC

**Total Support Estimate (TSE)**

*Transfers from consumers*

*Transfers from taxpayers*

*Budget receipts*

Percentage TSE (as a share of GDP)

policies have become more varied and complex, and more difficult to group into the previous PSE classification in ways that would permit a more accurate monitoring and evaluation of policy reform and its use in quantitative policy analysis.

In reflecting these policy developments, a new PSE classification has been devised and agreed, as outlined in Boxes A.2 and A.3. The key underlying criteria for the new classification is that the policy measures continue to be classified according to the way they are implemented. The proposed categories differ depending on:

- The transfer basis for support: output (Category A), input (Category B), area/animal numbers/revenues/incomes (Categories C, D and E), non-commodity criteria (Category F).
- Whether the support is based on current (Categories A, B, C, F) or historical (fixed) basis (Categories D and E, as well as F, depending on implementation conditions).
- Whether production is required (Categories C and D) or not (Category E).

### Box A.2. Classification of PSE applied from 2007

#### **A. Support based on commodity output**

- A.1. Market price support (MPS)
- A.2. Payments based on output

#### **B. Payments based on input use**

- B.1. Variable input use with input constraints
- B.2. Fixed capital formation with input constraints
- B.3. On-farm services with input constraints

#### **C. Payments based on current A/An/R/I, production required**

- C.1. Based on current revenue/income
- C.2. Based on current area/animal numbers with input constraints

#### **D. Payments based on non-current A/An/R/I, production required**

#### **E. Payments based on non-current A/An/R/I, production not required**

- E.1. Variable rates
- E.2. Fixed rates

#### **F. Payments based on non-commodity criteria**

- F.1. Long-term resource retirement
- F.2. Specific non-commodity output
- F.3 Other non-commodity criteria

#### **G. Miscellaneous payments**

Labels to be attached to programmes in the above categories of policy measures:

- ❖ With/without L (with or without current commodity production limits and/or payment limits).
- ❖ With V/F rates (with variable or fixed payment rates).
- ❖ With/without input constraints (C) (With Mandatory/With Voluntary/Without input constraints).
- ❖ With/without E (with or without any commodity exceptions).
- ❖ Based on A/An/R/I (based on area, animal numbers, receipts or income).
- ❖ Based on SC/GC/AC (based on a single commodity, group of commodities or all commodities).

Note: A (area), An (animal numbers), R (receipts) or I (income).

In addition to categories, the new PSE classification includes labels that may be applied to individual policies to provide further specification on the way each measure is implemented: with or without production limits or input constraints, whether payments are at fixed or variable rates (Box A.3). The applied labels are provided in the *PSE Database*. Labels may be used alternatively as additional sub-categories of the classification as needed, either in the standard tables or for special purposes (e.g. production of “satellite” tables, use in further quantitative or empirical analysis).

The definitions of the categories and labels in the new PSE classification are shown in Box A.3.

### Box A.3. Definitions of categories in the new PSE classification

#### Definitions of categories:

**Market price support (MPS):** transfers from consumers and taxpayers to agricultural producers from policy measures that create a gap between domestic market prices and border prices of a specific agricultural commodity, measured at the farm gate level.

**Payments based on output:** transfers from taxpayers to agricultural producers from policy measures based on current output of a specific agricultural commodity.

**Payments based on input use:** transfers from taxpayers to agricultural producers arising from policy measures based on on-farm use of inputs:

- **Variable input use** that reduces the on-farm cost of a specific variable input or a mix of variable inputs.
- **Fixed capital formation** that reduce the on-farm investment cost of farm buildings, equipment, plantations, irrigation, drainage, and soil improvements.
- **On-farm services** that reduce the cost of technical, accounting, commercial, sanitary and phyto-sanitary assistance and training provided to individual farmers.

**Payments based on current A/An/R/I, production required:** transfers from taxpayers to agricultural producers arising from policy measures based on current area, animal numbers, receipts, or income, and requiring production.

**Payments based on non-current A/An/R/I, production required:** transfers from taxpayers to agricultural producers arising from policy measures based on non-current (i.e. historical or fixed) area, animal numbers, receipts, or income, with current production of any commodity required.

**Payments based on non-current A/An/R/I, production not required:** transfers from taxpayers to agricultural producers arising from policy measures based on non-current (i.e. historical or fixed) area, animal numbers, receipts, or income, with current production of any commodity not required but optional.

**Payments based on non-commodity criteria:** transfers from taxpayers to agricultural producers arising from policy measures based on:

- **Long-term resource retirement:** transfers for the long-term retirement of factors of production from commodity production. The payments in this subcategory are distinguished from those requiring short-term resource retirement, which are based on commodity production criteria.
- **A specific non-commodity output:** transfers for the use of farm resources to produce specific non-commodity outputs of goods and services, which are not required by regulations.
- **Other non-commodity criteria,** transfers provided equally to all farmers, such as a flat rate or lump sum payment.

**Miscellaneous payments:** transfers from taxpayers to farmers for which there is a lack of information to allocate them among the appropriate categories.

#### Definitions of labels

**With or without current commodity production limits and/or limit to payments:** defines whether or not there is a specific limitation on current commodity production (output) associated with a policy providing transfers to agriculture and whether or not there are limits to payments in the form of limits to area or animal numbers eligible for those payments. Applied in Categories A-F.

### Box A.3. Definitions of categories in the new PSE classification (cont.)

**With variable or fixed payment rates:** Any payments is defined as subject to a variable rate where the formula determining the level of payment is triggered by a change in price, yield, net revenue or income or a change in production cost. Applied in Categories A-E.

**With or without input constraints:** defines whether or not there are specific requirements concerning farming practices related to the programme in terms of the reduction, replacement, or withdrawal in the use of inputs or a restriction of farming practices allowed. Applied in Categories A-F. The payments with input constrains are further broken down to:

- Payments conditional on compliance with basic requirements that are mandatory (*with mandatory*);
- Payments requiring specific practices going beyond basic requirements and voluntary (*with voluntary*).

**With or without commodity exceptions:** defines whether or not there are prohibitions upon the production of certain commodities as a condition of eligibility for payments based on non-current A/An/R/I of commodity(ies). Applied in Category E.

**Based on area, animal numbers, receipts or income:** defines the specific attribute (i.e. area, animal numbers, receipts or income) on which the payment is based. Applied in Categories C-E.

**Based on a single commodity, a group of commodities or all commodities:** defines whether the payment is granted for production of a single commodity, a group of commodities or all commodities. Applied in Categories A-D.

Note: A (area), An (animal numbers), R (receipts) or I (income).

### Changes in the commodity indicators related to the PSE and CSE

Up until the 2005 report on *Agricultural Policies in OECD Countries: Monitoring and Evaluation* the data on PSEs and related indicators were also shown by commodity, in monetary values and in percentages (or ratios). These commodity data were calculated from adding the commodity specific levels of support (market price support and payments based on output of individual commodities) to the levels of support to commodities for all other policies estimated using various allocation keys (for example, on the basis of a given commodity's share in the value of total production of all commodities, or of crops or livestock only depending on the commodity coverage of a particular policy measure).

To reflect the way in which policies are evolving, with the gradual shift away from direct commodity-linked support, the **total PSE** will no longer be broken down into commodities. Instead the **total PSE** is broken down into four categories reflecting the flexibility given to farmers' production decisions within the various policy measures. In the current report only one of these categories is reported, namely the SCT, which is defined as follows:

- **Single Commodity Transfers (SCT):** the annual monetary value of gross transfers from policies linked to the production of a single commodity such that the producer must produce the designated commodity in order to receive the transfer. This includes broader policies where payments are specified on a per-commodity basis.

## **Indicators used in policy analysis**

### **Indicators related to total support**

The new PSE classification does not change the total PSE. The only change is its breakdown into new categories based on well-established implementation criteria (Box A.3). The relative indicators linked to the total PSE (%PSE, producer NPC and producer NAC) and CSE (%CSE, consumer NPC and consumer NAC) continue to be calculated as previously. The GSSE is also still expressed as a share of total TSE and the %TSE in relation to GDP. Annex A.1 provides definitions of these indicators.

### **Commodity specific indicators**

The changes in the application of the methodology do not allow a breakdown of the total PSE by commodity. Therefore, the %PSE by commodity and the producer NAC by commodity are no longer calculated, but the producer and consumer NPCs remain.

The Producer Single Commodity Transfer (Producer SCT) is by definition available for specific commodities, as well as the derived relative indicator the %SCT. As mentioned above, the SCT is the sum of transfers to producers through policies granted to a single commodity, the most important element of which is in most cases the market price support. The %SCT is the commodity SCT expressed as a share of gross farm receipts for the specific commodity. Compared to the previously used commodity %PSE (which included all PSE support), the %SCT includes only support provided through commodity specific policies.

For the CSE, in the absence of transfers from taxpayers to consumers (i.e. the situation in most cases), the CSE is the mirror image of the MPS and hence by definition is commodity specific. By applying the same principle of not using allocation keys to distribute transfers from taxpayers to consumers to commodities the commodity %CSE and the consumer NAC by commodity is no longer calculated. However, in most cases the consumer NPC is equal to the consumer NAC by commodity and captures all the transfers to (from) consumers. Hence, the consumer NPC is the main tool used to analyse support to consumers by commodity.

### **Use of labels in the PSE Database**

The use of labels gives considerable flexibility to break down the total PSE into categories reflecting specific characteristics of policies in an ad hoc manner (i.e. whether the policy includes a constraint on input use or not, or whether it is applied with or without production limits – see the definition of labels in Box A.3). When desired, the labels in the database may be used alternatively as additional sub-categories in the main classification framework. Currently labels are used in this way as subcategories in Category E.

The labels applied in the database can be used to produce specific aggregations of payments for the tables in the *Monitoring and Evaluation Report* to give emphasis to a specific implementation criteria used in the policies applied. The label information can be used also in quantitative analyse based on the *PSE Database*, e.g. PEM work or when linking policies with environmental issues (SAPIM).

### **The use of the new classification and related indicators in policy analysis**

The new classification of categories of policy measures, based, as ever, on how the policies are implemented, has the potential to show the degree of flexibility that farmers

have in their production choices and thus how different policies influence farmers' decisions to produce commodities and other goods and services using farm resources.

Some policy measures deliver support directly related to the amount of a specific commodity produced (market price support and payments based on commodity production) or variable inputs used. As shown by the results of the Policy Evaluation Model (PEM) on decoupling, these policy measures are the ones that potentially (*ex ante*) have the strongest influence on commodity production incentives although this effect is weakened in those countries that place constraints on output produced or inputs used. Policy measures that are designed to deliver support based on current parameters, such as area or animal numbers and require commodity production, have a potentially somewhat weaker influence on production incentives. Policy measures providing support based on historical parameters, such as the overall farm area or income situation of the farmer, have potentially much less influence on production incentives, while those that provide support based on non-commodity criteria (such as the provision of trees, stone walls and hedges), have potentially the least influence on production. Clearly, the actual impacts (*ex post*) will depend on many factors that determine the aggregate degree of responsiveness of farmers to policy changes – including any constraints on production. Neither the total PSE nor its composition in terms of different categories of policies can, therefore, be interpreted as indicating the actual impact of policy on production and markets. Policy analysis based on support composition can only provide information on the potential of some of the individual policy categories (A, part of B) to influence producer decisions, while for other categories (C) this potential is less clear, as they group more heterogeneous policies. It is only through model-based analysis (such as provided in the OECD'S PEM) or empirical analysis and the use of labels that firmer conclusions can be drawn regarding production and market impacts of given policy measures.

Against this background, the new classification of policy measures and the use of labels will be able to better reflect the evolution of the policy mix. It is thus possible to assess policy reform not only in terms of the trends in the overall level of support, but also in terms of whether there were shifts towards policies that have less potential to distort commodity production and trade. Identifying policy measures that provide support based on a mixture of current and past production variables and those that deliver support not based on farm commodity production provides a rich source of data to help to evaluate progress in policy reform. Moreover, the data base can be marshalled to illustrate developments on matters where specific policy interests within a country or across countries are important.

Policies in the PSE are classified according to the basis on which support is delivered (implementation criteria) and not on policy objectives or impacts. The new PSE data base will provide a wealth of material to engage in model-based analysis of the effects of different policy instruments on variables such as production, trade and the environment. Increasingly, countries are interested in knowing the extent to which policy measures are targeted to achieve the range of policy objectives (effectiveness), assessing the costs and benefits of those efforts (efficiency), and understanding the implications for the distribution of income (equity). In addressing these issues, it is important to recognise that the PSE needs to be complemented with other data, as well as with information on the overall policy mix. Moreover, the use and interpretation of PSE and associated indicators in comparisons across countries and time needs to be undertaken with care.

### 3. Measuring agricultural support in emerging economies: technical updates and improvements

In addition to the changes in PSE methodology discussed in Annex A.2 and incorporated for the first time into this edition of the report on *Agricultural Policies in Emerging Economies: Monitoring and Evaluation*, a significant effort has been made to update and improve the support estimates for the six emerging economies for which calculations are made. Results of this work have been incorporated into the *PSE Database* for the countries concerned and are reflected in the evaluations contained in this report. These improvements are briefly summarised below. The *Database* of support indicators for emerging economies is available on line: [www.oecd.org/tad/support/psecse](http://www.oecd.org/tad/support/psecse).

#### **Brazil**

##### **Market price support**

Changes were introduced into the calculation of market price support for cotton using improved data on conversion rates, marketing margins, and producer and wholesale prices. The revisions resulted in somewhat higher than previous market price support estimates for cotton.

##### **Budgetary payments**

A special focus was given to monitoring developments in farm debt. An overview of the most recent government decisions in 2008 concerning another large-scale restructuring of farm debt is contained in the Brazil country chapter. These concessions have not yet been implemented as the procedure obliges debtors to enrol in the announced restructuring schemes and undergo assessment of their liabilities. According to the Brazilian Ministry of Agriculture and Livestock, the enrolment has been marginal to date; the deadline for applications has been extended to mid-December 2008 and most likely will be postponed further. Therefore, the actual scale of the debt involved in new restructuring and the specific structure of concessions (which are highly differentiated according to types of loans and the condition of debtors) are currently unknown.

However, as done previously, the Brazil support estimates were updated to incorporate the currently active debt concessions implemented in the mid-1990s and first half of the 2000s. This concerns the Programme of Financial Assets Rehabilitation (PESA), Rural Debt Securitisation, and also debt concessions related to credit programmes for small farmers (PRONAF, PROCERA and PROGER). The support transfers originating from these active debt rescheduling schemes are estimated at BRL 2.1 billion (USD 971 million) per year on average for 2005-07. The transfer corresponds to an estimated interest gain from reduced interest and “good payer” rebates on restructured loans; it is classified in PSE Category B2 “Payments Based on Fixed Capital Formation”.

#### **Chile**

Like the other five countries, PSEs and related indicators of support have been estimated up to 2007 for Chile. However, as the *PSE Database* for Chile was only constructed in 2007/08, there was no need for major revisions to the methodology used for calculating transfers or the classification of support programmes for this edition of the report.

## **China**

### **Market price support**

Market price support calculations, including margins and quality adjustments, have been reviewed and cross-checked with a similar exercise undertaken recently within the World Bank study on distortions to agricultural incentives in China. The review found that no major changes in MPS calculations were needed with the exception of poultry. As China has become a consistent net importer of poultry since 2002, the previous price gap between domestic and international prices which was set at zero on the basis of China being a net exporter of poultry with no market price support policies identified, has been replaced by a price gap derived from the 2% tariff on poultry imports.

### **Budgetary payments**

To address concerns regarding the level of programme aggregation within budgetary transfers to agriculture, a two-step approach has been applied. First, a detailed overview of government expenditures to support rural areas, including a description of the various programmes, was prepared by a local expert to better differentiate between budgetary expenditures targeting agricultural producers, the agricultural sector as a whole and programmes supporting rural areas at large. Having distinguished programmes as targeting agricultural producers (PSE) and the agricultural sector as a whole (GSSE), more detailed information was sought to allow a greater disaggregation of budgetary payments, in particular for the period 2004-07. While the level of support for producers (%PSE) and for the sector as a whole (%GSSE) has changed only marginally due to this exercise, much better information has been gained on the structure of support, improving the classification of policies. In addition, a better understanding of the co-financing principles between central and local governments has been gained. To the extent possible, data on budgetary support to agriculture includes transfers from both central and sub-national governments.

## **Russia**

### **Market price support**

Estimates for beef, pigmeat and poultry have been revised for the period between 2000 and 2007 based on new definition of border prices. For all three types of meat, border prices were estimated as weighted averages of Russian unit values of imported i) frozen meat and ii) fresh and chilled meat, with weights being the shares of the two types of meat in total domestic meat processing. Border price used previously for beef and veal and poultry were for frozen (carcass) meat; while for pigmeat prices for fresh and chilled (carcass) meat were applied. The weighting procedure allows for better comparability of border and domestic price (in terms of composition of fresh and chilled meat). The change introduced resulted in lower MPS estimates for beef and poultry, since the weighting takes into account higher-priced import (fresh and chilled meat) and therefore yields higher average border price. For pigmeat, the change resulted in higher MPS, as the revised price takes into account lower-priced import (frozen meat) and therefore results in lower average border price.

### **Budgetary payments**

Attention was given to reviewing sub-national expenditure. The Russian Federation consists of 83 sub-national territorial units that form and execute regional budgets. The support estimates for all years incorporate budgetary transfers from both the federal and

regional levels. For the current report, an effort was made to account more accurately for the regional component and, possibly, improve the classification of regional financing within the various PSE and GSSE categories. Concerning the latter task, the Russian budgetary reporting system contains enough detailed information on co-financed (at federal and regional levels) programmes, with additional information on the composition of regional expenditure derived from reports detailing the implementation of nationwide programmes relating to special issues such as the Soil Fertility Programme, Social Development of Rural Areas and others. However, a portion of regional expenditure enters the official budgetary reporting system in a highly aggregated form (e.g. in groupings such as “support for crop production” or “support for livestock production”). Although it is generally possible to distinguish groupings according to whether they benefit producers individually (PSE) or collectively (GSSE), it is not possible to classify the expenditure to specific categories within these two components. Consequently, a share of regional expenditure (12% in 2006 and 27% in 2007) continues to be classified in PSE Category G “Miscellaneous”. Further improvement does not seem feasible, given the existing state budget reporting system. It may prove useful to undertake case studies looking at agricultural budgets for a number of Russian regions with different policy profiles. This analysis, however, goes beyond the framework of OECD’s regular policy monitoring.

## **South Africa**

### **Market price support**

The reference prices for maize, wheat and sugar have been checked with local experts and additional information on policies creating the price gap was sought. Based on this information, the reference price series were adjusted for all three commodities. Consequently, the new price gap estimates reflect better the applied border measures, the only policy instruments creating a price gap. The margins (processing and transportation costs) for sheepmeat and sugar have also been verified and updated based on information received from local experts. Overall, the improvement in the price gap measurement and hence the MPS are now more consistent with the policy measures applied.

### **Budgetary payments**

In recent years the most important budgetary payments relate to the implementation of the land reform and related programmes assisting farmers emerging from the reform process. New policy information and budgetary data on expenditures linked with the land reform have been provided by the South African Department of Land Affairs. This new information helped to split budgetary payments financing the land reform into three broad groups:

- Budgetary transfers to individual farms to be included in the PSE (i.e. land grants, investment grants).
- Budgetary transfers financing general services to the sector included in the GSSE (i.e. education and training, dissemination of information, infrastructure improvements, land reclamation).
- Budgetary transfers not included in the estimates of support to agriculture (neither the PSE nor the GSSE – i.e. administration expenditures, budgetary expenditure spent on restitutions).

## **Ukraine**

### **Market price support**

A change was introduced in the reference price calculation for wheat for 2006-07. As Ukraine imposed export quotas on wheat for most of the period 2006 to mid-2008, Ukrainian export wheat prices, used previously for the reference price calculation, no longer represented an appropriate reference. A weighted average of the International Grains Council quotations for feed and milling wheat was used (f.o.b. Black Sea), with weights being the shares of feed and milling wheat in total Ukrainian domestic production.

### **Budgetary payments**

An estimated implicit transfer to producers arising from loans provided against pledged grain, not previously included in the estimates, was incorporated into the Ukrainian PSE and classified in Category A2 "Payments based on output". This had a marginal impact on the PSE and related indicators as the programme is very small. The transfer values are estimated by the Ukrainian Ministry of Agrarian Policy. The mechanism of this programme is similar to the Commodity Loans programme in the United States.

<b>UAH</b>	Ukrainian hryvnia
<b>USD</b>	United States dollar
<b>ZAR</b>	South African rand

## Table of contents

<b>Foreword</b> .....	3
<b>List of Acronyms and Abbreviations</b> .....	11
<b>Executive Summary</b> .....	15
<b>Chapter 1. Overview</b> .....	17
Developments in world food markets .....	18
Main changes in agricultural policies .....	23
Developments in agricultural support .....	27
Policy observations and recommendations .....	37
Bibliography .....	38
<b>Chapter 2. Brazil</b> .....	41
Summary of policy developments .....	42
Policy context: Brazil agriculture at a glance .....	44
Policy developments .....	45
Bibliography .....	59
<b>Chapter 3. Chile</b> .....	61
Summary of policy developments .....	62
Policy context: Chile's agriculture at a glance .....	64
Policy developments .....	65
Bibliography .....	75
<b>Chapter 4. China</b> .....	77
Summary of policy developments .....	78
Policy context: China's agriculture at a glance .....	80
Policy developments .....	81
Bibliography .....	93
<b>Chapter 5. India</b> .....	95
Overview of support estimates for Indian agriculture .....	96
Policy context: India's agriculture at a glance .....	98
Policy developments .....	99
Bibliography .....	112
<b>Chapter 6. Russia</b> .....	113
Summary of policy developments .....	114
Policy context: Russia's agriculture at a glance .....	116
Policy developments .....	117
Bibliography .....	134

Chapter 7. <b>South Africa</b> .....	135
Summary of policy developments .....	136
Policy context: South Africa's agriculture at a glance .....	138
Policy developments .....	139
Bibliography .....	147
Chapter 8. <b>Ukraine</b> .....	149
Summary of policy developments .....	150
Policy context: Ukraine's agriculture at a glance .....	152
Policy developments .....	153
Bibliography .....	165
Annex A. <b>Measuring Agricultural Support</b> .....	167
1. Definitions of OECD indicators of agricultural support .....	167
2. The PSE classification .....	168
3. Measuring agricultural support in emerging economies: technical updates and improvements .....	177
Annex B. <b>Statistical Annex</b> .....	181
 <b>Boxes</b>	
1.1. Potential impacts on agriculture of the financial crisis .....	22
1.2. Why does the PSE change when world prices change? .....	31
2.1. Food price inflation in Brazil .....	46
2.2. The 2008 debt settlement package in Brazil .....	53
3.1. Food price inflation in Chile .....	66
3.2. Structural changes: Preliminary results from the 2007 Agricultural Census in Chile .....	73
4.1. Food price inflation in China .....	82
5.1. Food price inflation in India .....	100
6.1. New regulatory and administrative framework for agricultural policies in Russia .....	118
6.2. Food price inflation in Russia .....	119
7.1. Food price inflation in South Africa .....	140
7.2. Trade agreements involving South Africa .....	145
8.1. Food price inflation in Ukraine and government's responses .....	154
8.2. Ukraine's WTO commitments in agriculture .....	162
A.1. Classification of PSE and related support indicators applied until 2006 .....	171
A.2. Classification of PSE applied from 2007 .....	172
A.3. Definitions of categories in the new PSE classification .....	173
 <b>Tables</b>	
1.1. Policy measures taken by governments to reduce the impact of higher food prices .....	24
1.2. Contribution to the change in Producer Support Estimate, 2006 to 2007 .....	29
1.3a. Contribution to the change in Market Price Support, 2006 to 2007 .....	30
1.3b. Contribution to the change in border price, 2006 to 2007 .....	30
1.4. Single Commodity Transfers by commodity, 2005-07 .....	34
2.1. Brazil: Estimates of support to agriculture .....	43
2.2. Brazil: Basic economic and agricultural indicators, 2005-07 .....	44
2.3. Brazil: AGF minimum guarantee prices for main programme crops, 2005-09 .....	48
2.4. Brazil: Expenditure and volume of product by output support instrument, 2005-07 .....	49

2.5. Brazil: Annual credit allocations in the SNCR, 2003-07 .....	51
3.1. Chile: Estimates of support to agriculture .....	63
3.2. Chile: Basic economic and agricultural indicators, 2005-07 .....	64
3.3. Number and area of agricultural and forestry operations by type in Chile, 1997 and 2007 .....	73
3.4. Agricultural and forestry land use in Chile, by activity, 2007 .....	74
4.1. China: Estimates of support to agriculture .....	79
4.2. China: Basic economic and agricultural indicators, 2005-07 .....	80
4.3. Minimum purchase prices for grains in China, 2004-08 .....	84
5.1. India: Basic economic and agricultural indicators, 2005-07 .....	98
5.2. Minimum support prices in India for selected commodities, 2005-09 .....	102
6.1. Russia: Estimates of support to agriculture .....	115
6.2. Russia: Basic economic and agricultural indicators, 2005-07 .....	116
6.3. Russia's meat import quotas in 2005-09 .....	130
7.1. South Africa: Estimates of support to agriculture .....	137
7.2. South Africa: Basic economic and agricultural indicators, 2005-07 .....	138
7.3. South African Customs Union tariff schedule, August 2007 .....	144
8.1. Ukraine: Estimates of support to agriculture .....	151
8.2. Ukraine: Basic economic and agricultural indicators, 2005-07 .....	152
8.3. Ukraine: Credit received by agricultural enterprises in 2006-07 .....	158
8.4. Ukraine's import tariff rates on key agricultural products before and after WTO accession .....	163
B.1. Share of agriculture in total employment .....	182
B.2. Share of agriculture in GDP .....	182
B.3. Agricultural input price index .....	182
B.4. Agricultural output price index .....	183
B.5. Retail food price index .....	183
B.6. Gross Agricultural Output growth, total .....	183
B.7. Gross Agricultural Output growth, crops .....	184
B.8. Gross Agricultural Output growth, livestock .....	184
B.9. Total grain production .....	184
B.10. Wheat production .....	185
B.11. Coarse grain production .....	185
B.12. Total meat production .....	185
B.13. Beef and veal production .....	185
B.14. Piguement production .....	186
B.15. Milk production .....	186
B.16. Production of selected commodities in selected developing countries .....	187
B.17. Average share of household income spent on food .....	189
B.18. Annual consumption of grain and grain products .....	189
B.19. Annual consumption of meat and meat products .....	189
B.20. Annual consumption of milk and dairy products .....	190
B.21. Total area sown, crops .....	190
B.22. Grain sown areas .....	190
B.23. All cattle inventories .....	191
B.24. Pig inventories .....	191

## Figures

1.1. Changes in nominal international prices for selected agricultural commodities since 2005 .....	19
1.2. Changes in nominal prices for selected energy, fertiliser and freight costs since 2005 .....	21
1.3. Inflation, consumer prices, annual average, 2000-08 .....	21
1.4. Agricultural and food trade balance, 1995 and 2007 .....	25
1.5. Evolution of producer support levels, 1997 to 2007 .....	28

1.6. Composition of producer support, 1995-97 and 2005-07 .....	32
1.7. Producer Nominal Protection Coefficients, 1995-97 and 2005-07 .....	33
1.8. Single Commodity Transfers as a share of PSE, 1995-97 and 2005-07 .....	34
1.9. Level and composition of General Services Support Estimate, 2000-02 and 2005-07 .....	35
1.10. Composition of Total Support Estimate, 1995-97 and 2005-07 .....	36
2.1. Brazil: PSE level and composition over time .....	42
2.2. Brazil: Producer SCT by commodity, 2005-07 .....	42
2.3. Brazil: Evolution and annual changes of agricultural output, 1995-2007 .....	44
2.4. Brazil: Agro-food trade, 1995-2007 .....	44
2.5. Brazil: Consumer price indices in 2006-08 .....	47
3.1. Chile: PSE level and composition over time .....	62
3.2. Chile: Producer SCT by commodity, 2005-07 .....	62
3.3. Chile: Evolution and annual changes of agricultural output, 1995-2007 .....	64
3.4. Chile: Agro-food trade, 1995-2007 .....	64
3.5. Chile's monthly wholesale prices of wheat and maize compared with world market prices, 2006-08 .....	66
3.6. Chile's CPI compared with oil prices and exchange rate .....	67
3.7. Chile: Shares of agricultural transfers by programme area, 2007 .....	68
4.1. China: PSE level and composition over time .....	78
4.2. China: Producer SCT by commodity, 2005-07 .....	78
4.3. China: Evolution and annual changes of agricultural output, 1995-2007 .....	80
4.4. China: Agro-food trade, 1995-2007 .....	80
4.5. China's monthly wholesale prices of wheat, rice, maize and soybeans compared with world market prices, 2006-08 .....	83
5.1. Average Nominal Rates of Assistance in India, 1965-2004 .....	96
5.2. Nominal Rate of Assistance in India by commodity, 2000-04 .....	96
5.3. India: Evolution and annual changes of agricultural output, 1995-2007 .....	98
5.4. India: Agro-food trade, 1995-2007 .....	98
5.5. India's monthly wholesale prices of wheat, rice, maize and soybeans compared with world market prices, 2007-08 .....	101
6.1. Russia: PSE level and composition over time .....	114
6.2. Russia: Producer SCT by commodity, 2005-07 .....	114
6.3. Russia: Evolution and annual changes of agricultural output, 1995-2007 .....	116
6.4. Russia: Agro-food trade, 1996-2007 .....	116
6.5. Russia: Consumer price indices in 2007-08 .....	119
6.6. Russia: Retail price growth rates for key food items .....	120
6.7. Russia: Components of the State Programme for Development of Agriculture in 2008-12 .....	121
6.8. Russia: Expenditures under the Financial Sustainability Component of the State Programme .....	121
6.9. Russia: Concessional credit allocations in 2005-08 .....	124
6.10. Russia: Budgetary expenditures related to concessional credit, 2005-08 .....	125
6.11. Russia: Distribution of agricultural land by type of farm, as of 1 July 2006 .....	128
6.12. Russia: Share of farms reporting agricultural operations in 2006 .....	128
6.13. Russia: Share of utilised agricultural land in farms of different type in 2006 .....	129
7.1. South Africa: PSE level and composition over time .....	136
7.2. South Africa: Producer SCT by commodity, 2005-07 .....	136
7.3. South Africa: Evolution and annual changes of agricultural output, 1995-2007 ..	138
7.4. South Africa: Agro-food trade, 2000-07 .....	138
7.5. South Africa: Consumer Price Indexes for food and selected food products .....	140
7.6. South Africa: Percentage distribution of annual household consumption expenditure by expenditure group and income deciles .....	141
8.1. Ukraine: PSE level and composition over time .....	150
8.2. Ukraine: Producer SCT by commodity, 2005-07 .....	150

---

8.3. Ukraine: Evolution and annual changes of agricultural output, 1995-2007 . . . . .	152
8.4. Ukraine: Agro-food trade, 1996-2007 . . . . .	152
8.5. Ukraine: Consumer price indices in 2007-08 . . . . .	154
8.6. Ukraine: Retail price growth for key food items . . . . .	156
8.7. Ukrainian applied import tariffs on key agricultural products . . . . .	163
8.8. Ukrainian wheat export quota and wholesale wheat prices in 2006-08 . . . . .	164
