

Foreword

The *Eurostat-OECD compilation guide on land estimation* represents the first comprehensive overview of conceptual and practical issues related to the compilation of the balance sheet item 'land' in the national accounts.

The aim of the compilation guide is to provide conceptual and practical guidance to statisticians concerning the estimation and valuation of land and to increase international comparability. The guide clarifies theoretical concepts and proposes a breakdown of land into categories so that international comparisons can be more easily made. It also discusses possible data sources, elaborates direct and indirect estimation methods and addresses several special estimation cases. The guide presents the information that is available on this topic in the System of National Accounts 2008 and in the European System of Accounts 2010 in a systematic and accessible way. It draws on a wide range of experience and expertise by reviewing the methods used in estimating land in an attempt to describe practical and suitable measurement methods.

The primary purpose of the compilation guide is to help producers of national accounts data on land. As such, the manual is designed to help them prepare reliable estimates that are comparable between countries. This particularly applies to countries that are in the process of developing estimates for land. The guide therefore includes country examples that illustrate the practical application of the guidelines.

However, the compilation guide is also useful to users of the data. For them the guide not only provides background information about how data on land can be compiled, but also about the limitations of the data. In addition, the final chapter discusses more specifically the use of the data especially in assessing the wealth of households.

Since data for land are often not available it is hoped that this compilation guide will help countries to fill in the information gaps exposed by the 2007–2008 financial crisis. This is of particular importance in view of the housing market's role in the financial crisis in several countries. Compiling estimates of land will move countries one step closer to providing a complete set of information on a nation's balance sheet.

The electronic version of the *Eurostat-OECD compilation guide on land estimation* is available on the websites of Eurostat and the OECD.

We trust that this guide will be a useful resource to both compilers and users of data on land, and wish to express our sincere thanks to all those involved in its production.

Martine Durand
OECD Chief Statistician and Director of Statistics

Walter Radermacher
Director-General of Eurostat

Preface and acknowledgements

The *Eurostat-OECD compilation guide on land estimation* was prepared by the Task Force on Land and other non-financial assets. Both Eurostat and the Organisation for Economic Co-operation and Development (OECD) consider the compilation of non-financial assets, and in particular land, as a high priority and therefore it was decided to bundle the resources and to create a joint Eurostat-OECD Task Force.

Apart from the growing importance of balance sheet data in general, there were two more specific reasons for the establishment of this Task Force. First, in 2011 at a conference organised by the OECD and the International Monetary Fund (IMF) on strengthening the sectoral balance sheets there were repeated calls for better estimates of land on the balance sheet. Thus, the OECD considered that this issue needed further study considering the lack of information on land currently available at the time. Second, in the discussions on the European System of Accounts 2010 transmission programme, the Council Working Party on Statistics agreed with a (partially) mandatory transmission of the balance sheet item land, but also requested more guidance regarding its compilation. As a follow-up, Eurostat's National Accounts Working Group decided in its April 2012 meeting to establish the Task Force on Land and other non-financial assets; this decision was supported by the OECD's Working Party on National Accounts. The joint Eurostat-OECD Task Force started its work in June 2012.

Representatives from various European Union (EU) and non-EU OECD countries were represented in the Task Force and the European Central Bank participated as well. The Task Force was chaired by Silke Stapel-Weber/Hans Wouters (Eurostat) and Peter van de Ven/Jennifer Ribarsky (OECD). Other members of the Task Force were, in alphabetical order: Taehyoung Cho (Korea), Florian Gruber/Elisa Huber (Austria), Christian Gysting (Denmark), Ville Haltia/Martti Pykari (Finland), Wesley Harris (United Kingdom), Ruben van der Helm/Zlatina Balabanova (ECB), Marllena Ifrim/Brenda Bugge (Canada), Bob Kornfeld (US), Gang Liu (Norway), Martina Nemeckova (Czech Republic), Paolo Passerini (Eurostat), Ghislain Pouillet (Belgium), Paola Santoro (Italy), Oda Schmalwasser/Sascha Brede (Germany), Tatjana Smokova (Eurostat), Nina Strazisar (Slovenia), Martha Tovar (Mexico), Erik Veldhuizen/Joy Sie Cheung (The Netherlands).

The Task Force on Land and other non-financial assets met six times:

- 9–10 July 2012 Eurostat, Luxembourg
- 10–11 December 2012 OECD, Paris
- 24–25 June 2013 Statistics Austria, Vienna
- 2–3 December 2013 Destatis, Wiesbaden
- 26–27 June 2014 Statistics Canada, Ottawa
- 8–9 December 2014 Czech statistical office, Prague

All Task Force members actively contributed to the work and drafted chapters or sections of the compilation guide. The work on the compilation guide was coordinated by Hans Wouters (Eurostat). The editing was performed by Jennifer Ribarsky (OECD). The draft chapters and preliminary versions of the compilation guide were available for comments on Eurostat's website.

The *Eurostat-OECD compilation guide on land estimation* benefitted from contributions of many countries that replied to the questionnaire on depreciation and service lives and the questionnaire on classification of land. The manual also benefitted from the comments that have been received from Eurostat's National Accounts Working Group, OECD's Working Party on National Accounts, the Advisory Expert Group, Eurostat's units Agriculture and fisheries, Environmental statistics and accounts and Regional statistics and geographical information.

Eurostat and OECD would like to thank all those who contributed to the *Eurostat-OECD compilation guide on land estimation*.

Contents

Foreword	3
Preface and acknowledgements	4
1. Why do we need this compilation guide?	11
Introduction	12
Assets and the importance of land	13
Purpose and structure of this compilation guide	14
Annex: Balance sheet for non-financial assets	16
2. Concepts and definitions	17
Introduction	18
Position of land on the balance sheet and definitions of land and related assets	18
Position of land on the balance sheet	18
Definitions	19
Clarifications definitions and borderline cases	19
Disaggregation of land and definition of components	20
Conceptual issues	20
Ownership and economic benefits from land	20
Ownership related to the lease of land and public-private partnerships	21
Land in the system of national accounts	21
Valuation	25
Time of recording	26
Netting and consolidation	27
Data issues in the measurement of flows of land	27
Annex: Distinguishing other changes in volume from holding gains and losses	28
Introduction	28
Description of the issue	28
Conceptual issues in identifying quality changes	28
Practical advice	31
3. Classification of land	33
Introduction	34
Why do we need a new classification?	34
Existing approaches for classifying land	35
Proposed classification of land	36
Definitions	37
Borderline cases	38
Case studies	39
Case study classification: Korea	39
Case study classification: Germany	40

4. Data sources	43
Introduction	44
Description of issue	44
Types of data available	44
Administrative source	44
Case study sources: Australian cadastral system	45
Collection sources	45
Prices	46
Other types of information	47
Summary	47
Case study proxy data: European Central Bank	47
Annex: Results from 2011 OECD survey on land valuation in the national accounts	49
5. Direct estimations of land	53
Introduction	54
Description of the method	54
a) Estimation of land area by land types in a single year or over a couple of years	54
b) Estimation of changes in the land types annually to produce time series	55
c) Estimation of representative unit prices for each relevant land type for a single year or a couple of years	56
d) Modelling the price changes for each land type over time (specifying price indices) in order to produce unit price time series	57
e) Bringing together the area and price information to produce time series on land value (for all relevant years)	57
f) Specifying volume changes and price changes per year	57
Case study: alternative way for estimating holding gains and losses	59
Strengths and weaknesses	59
Case study direct method: Korea	60
Estimating the land area	60
Estimating the market price of land	61
Estimating the total value of land	61
6. Indirect estimations of land	65
6.1 Methods for estimating the combined value of land and structures	66
Introduction	66
Definition and characteristics	66
Description of the methods	67
Appraisals	67
'Quantity times price' approach	72
Case study estimating the combined value of land and structures: The Netherlands	75
Data sources	75
Methods	75
Case study estimating the combined value of land and structures: Australia	76
Data sources	76
Methods	77
Output	78

6.2	The residual approach	78
	Introduction	78
	Description of the method	78
	Numerical example	79
	Applicability of the residual approach	80
	Strengths of the residual approach	81
	Weaknesses of the residual approach	81
	Applicability of the residual approach	81
	The value of land as a by-product of other estimates	81
	Other issues related to the residual approach	82
	Case studies	82
	Case study residual approach: Italy	82
	Case study residual approach: Denmark	84
	Case study comparison direct and residual method: Finland	85
6.3	The land-to-structure ratio approach	88
	Introduction	88
	Description of the method	88
	Estimation of structures value	88
	Estimation of land-to-structure ratio	88
	Data requirements	89
	Data requirements for the estimation of the value of dwellings and other buildings and structures	89
	Data requirements for the estimation of land-to-structure ratios	89
	Sectoral dimension	90
	Strengths and weaknesses	90
	Case study land-to-structure-ratio approach: Canada	91
	Residential land	91
	Non-residential land	93
6.4	The hedonic approach	94
	Introduction	94
	Description of method	94
	Distinguishing the representative property price from price indices	94
	A simple hedonic regression model	94
	Expanding the model	94
	An example	95
	Dealing with multicollinearity	95
	Data requirements	96
	Strengths and weaknesses	96
	Case study hedonic approach: Denmark	96
	Problematic alternative	96
6.5	The importance of service lives and depreciation for indirect land estimates	97
	Overview of the survey	97
	Respondents and the use of the PIM	97
	Overview of capital measurement and the PIM	98
	Linear depreciation, with and without additional retirement distributions	99

Geometric depreciation	100
Other patterns of depreciation and retirement	101
Comparing depreciation patterns across countries	102
Sources of information for the assumptions of the PIM	107
Transfer of ownership costs and improvements to structures	107
Net stocks of structures relative to GDP	108
Government owned land	109
Major concerns and plans for the future	109
Conclusions	110
Case study depreciation estimates: United States	110
7. Sectorisation and cross-classification	113
Introduction	114
Definitions	114
Why are sectorisation and cross-classification important?	115
Methods of estimating the value of land by sector or cross-classification	115
Direct method	116
Indirect methods — the residual approach	117
Indirect methods — the land-to-structure ratio approach	118
Hedonic approach	119
Summary of approaches	120
Challenges	120
Data sources	120
Shared land	120
Shared ownership	120
Households as producers/unincorporated enterprises	120
Changes in classification or sector allocation	121
Case study sectorisation and cross-classification of land: The Netherlands	121
Introduction	121
Land underlying dwellings (estimated using indirect method)	121
Land under cultivation (estimated using direct method)	122
8. Some special estimation cases	125
8.1 Agricultural land and wooded land available for wood supply	126
Agricultural land	126
Introduction	126
Classification of agricultural land	126
Sources	127
Area	127
Prices	127
Methodology on agricultural land prices	127
Valuation of agricultural land	128
Wooded land available for wood supply	128
Classification and registration of wooded land available for wood supply	128

Case study estimating the value of land underlying timber: Finland	130
Introduction	130
The residual approach for forestry land	130
The direct method	131
8.2 Land improvements	132
Introduction	132
Definition, characteristics and data sources	132
Separation of land improvements from land	133
Borderline between land improvements and dwellings and other buildings and structures	134
Accounting examples	134
Example 1: land entering the asset boundary as a consequence of activity in the vicinity	134
Example 2: land value change as a consequence of activity in the vicinity	135
Example 3: land entering the asset boundary as a consequence of activities on the piece of land	135
Example 4: land improvements as a consequence of activities on the piece of land	136
Case study estimating land improvements: Finland	136
8.3 Treatment of government owned land	138
Introduction	138
Scope of balance sheets for government owned land	138
Licences and permits to use government owned land	139
Valuation of government owned land	139
Overview of country practices	140
Case study government owned land: Germany	141
Source 1: information from budget funds data	141
Source 2: information from transactions data	141
9. The value of land and its contribution to wealth	143
9.1 Dwellings and land underlying dwellings as a storage of wealth	144
Introduction	144
The concept of dwellings and wealth analysis	144
Dwellings as a storage of wealth for households and non-profit institutions serving households	145
Dwellings as a storage of wealth at the national level	145
9.2 Households' real estate wealth data as an indicator in macroeconomic and financial analysis	147
List of abbreviations and acronyms	152
Glossary	153
Bibliography	165
