## ORGANISATION FOR ECONOMIC CO-OPERATION AND DEVELOPMENT

Under Article 1 of the Convention signed in Paris on 14th December 1960, and which came into force on 30th September 1961, the Organisation for Economic Co-operation and Development (OECD) shall promote policies designed:

- to achieve the highest sustainable economic growth and employment and a rising standard of living in member countries, while maintaining financial stability, and thus to contribute to the development of the world economy;
- to contribute to sound economic expansion in member as well as non-member countries in the process of economic development; and
- to contribute to the expansion of world trade on a multilateral, non-discriminatory basis in accordance with international obligations.

The 20 original member countries of the OECD are Austria, Belgium, Canada, Denmark, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom and the United States. The following 10 countries became members subsequently: Japan (1964), Finland (1969), Australia (1971), New Zealand (1973), Mexico (1994), the Czech Republic (1995), Hungary (1996), Poland (1996), Korea (1996) and the Slovak Republic (2000). The Commission of the European Communities takes part in the work of the OECD (Article 13 of the OECD Convention).

Notes:

Data are OECD estimates

- not applicable

1. Purchasing Power Parities (PPPs) are the rate of currency conversion which eliminates the differences in price levels between countries. They are used to compare the volume of GDP in different countries. PPPs are obtained by evaluating the costs of a basket of goods and services between countries for all components of GDP; PPPs are given in national currency units per US dollar

2. Countries still using the System of National Accounts (SNA) 1968.

Notes:

.. not available

1999. International comparisons also have to take into account differences between countries in the width of tax brackets, the amount of tax reliefs and rates of social security contributions. The highest rate of income taxes includes temporary special surcharges. All rates include (average) rates of state and local income taxes as reported in the OECD Tax Data Base
1999. This percentage is influenced both by the overall tax level and the relative weight of personal income taxes and employees' social security contributions in national tax mixes

- One-earner family. Takes account of family allowances and/or tax reliefs
- Year 1997 for Total receipts and Tax structure figures
- Unweighted
  - Including self-employment or non-employed
  - Retained profits, includes highest local business tax.

+ growth more than 500%

1. These figures are based on an assumption of 100% efficiency for hydro-electric, 33% for nuclear and approximately 10% for geothermal plants; preliminary data

2. Million tonnes of oil equivalent

3. Total primary energy supply (in Mtoe) divided by GDP (in constant prices; 1990 dollars)

4. Includes hydro, geothermal, solar, wind, combustible renewables, waste and international trade in electricity.

Notes:

- Carbon dioxide (CO<sub>2</sub>) emissions estimates are calculated using the IEA energy balances and the default methods and emission factors from the *Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories*. They may differ from National Communications submitted by the Parties to the UNFCCC
- Excludes international marine and aviation bunkers

- Tonnes of CO<sub>2</sub> per terajoule; TPES, Total Primary Energy Supply
- Kilogrammes of CO<sub>2</sub> per 1990 USD
- Tonnes of CO<sub>2</sub> per capita.

## GDP growth

average annual real change  
%, 1990-2000

GDP growth was buoyant in several OECD countries in the 1990s, with Ireland leading the group with an average of over 7% per year in the 10 years to 2000. A third of OECD countries managed growth rates of over 3%, the United States being the only G7 country to do so. However, the OECD as a whole grew by 2.6%. Four of the G7 countries – France, Germany, Italy and Japan – all posted growth rates of less than 2%.

Despite this rather modest picture, in 2000 there were some strong growth performances in the OECD area (see table page 14). In fact, GDP growth accelerated in most countries. Japanese growth rose from near stagnation to nearly 2%, and the US economy expanded by 5.2% compared with 3.6% in the previous year. Germany too nearly doubled its rate of growth.

## GDP per capita

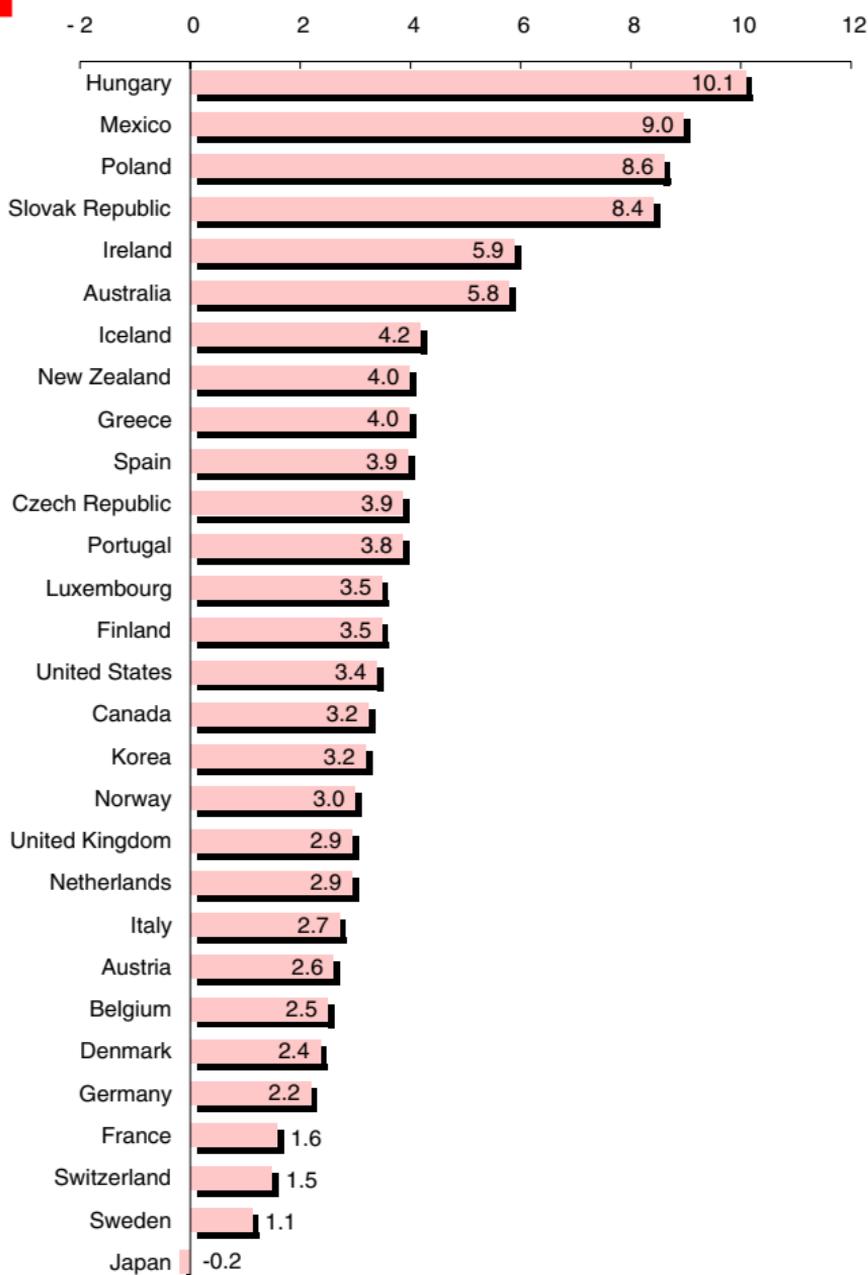

USD, using PPPs, 2000

The pattern of GDP per capita has remained fairly stable since 1999. Luxembourg remains at the top, with US\$45 000 per capita in purchasing power parity terms, a measure which eliminates the price differentials between countries (see Note 1 page 13). The United States had the second highest level, at \$36 000. Fast growing Ireland recorded a GDP per head of \$28 500 in 2000, the fifth highest behind Norway and Switzerland. France, Italy, Sweden and the United Kingdom all had similar levels as each other with around \$23-24 000. In three OECD countries, GDP per head was below \$10 000, with Turkey being the lowest.

## Consumer prices

December 2000/December 1999  
% change

Inflation climbed a bit in 2000, to an OECD average of 3.7%, compared with an average of less than 3.6% in 1999. But without the high inflation countries of Turkey, Mexico, Poland and Hungary, inflation rose from 1.9% to 2.7%. The rate stood above 3% in several countries, with sharp increases in rapidly growing economies like Ireland and Australia. Apart from Turkey (not in chart), whose inflation rate was some 39% and sharply down on 1999, the highest inflation rate was recorded in Hungary. All the larger OECD European countries kept their inflation rates below the average, with France recording one of just 1.6%. Japan's inflation rate fell slightly over the 12 month period.

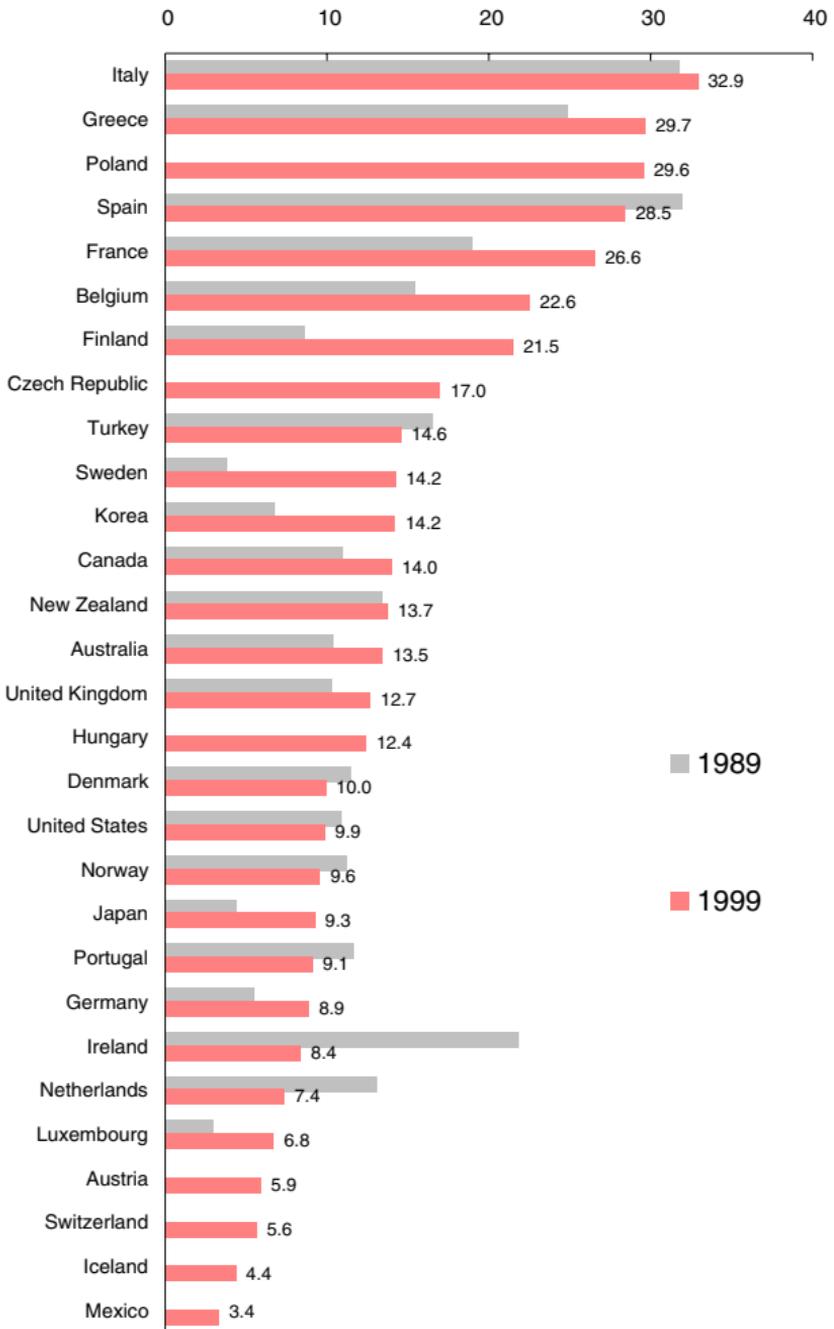

## Unemployment rates

% of civilian labour force, 1999

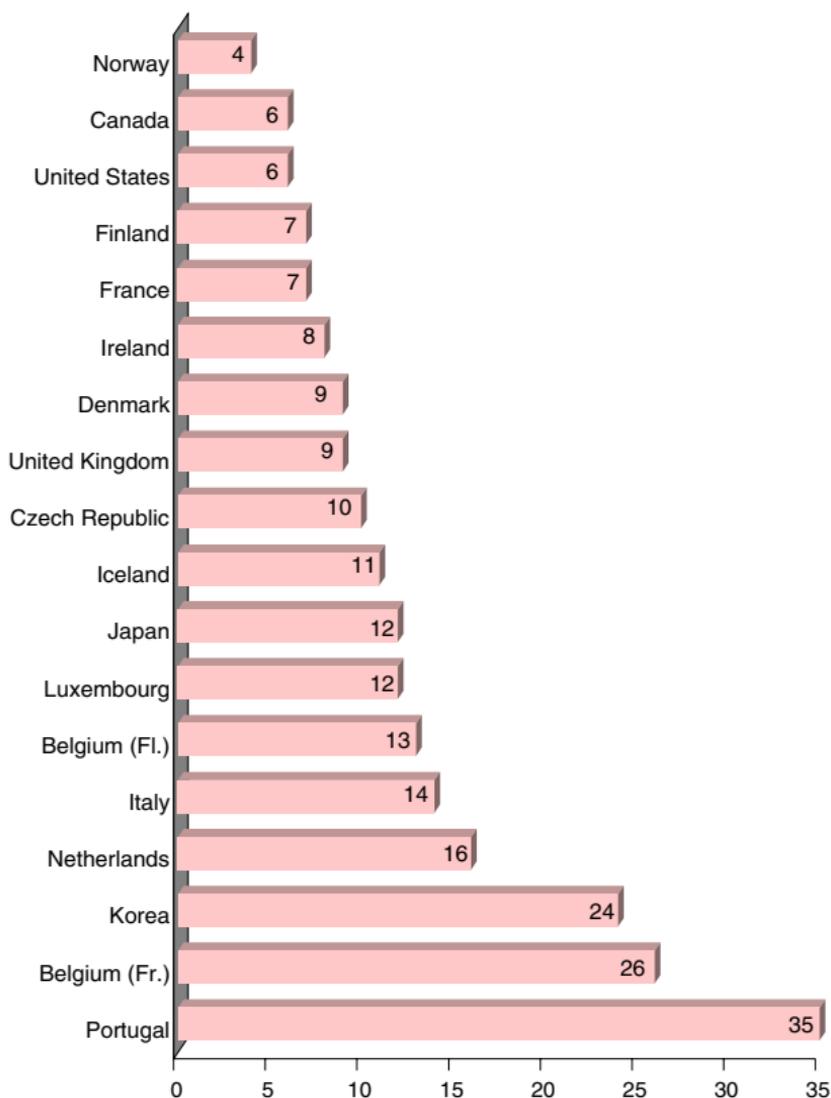

Unemployment remained steady in 1999 and preliminary figures point to continued stability in 2000. The lowest rates were in Mexico, Luxembourg and Iceland. Spain no longer had the highest unemployment rate, that mantle was taken by a new OECD member, the Slovak Republic. But for women, Spain's unemployment rate remained well ahead of the rest, at nearly a quarter of the female labour force, despite an improvement since the late 1980s. Female unemployment was lower than male unemployment in 11 OECD countries, compared with eight in 1998 and just four in 1997. US unemployment fell in 1999 and again in 2000, with a very slight rise estimated in early 2001.

## Youth unemployment (under 25) % of youth labour force, 1989-99

Despite the relatively favourable unemployment situation in 1999, youth unemployment remains a concern. In fact, it has risen in most OECD countries since 1989. The sharpest increases were in Belgium, Finland, France, Korea and Sweden. But France's youth unemployment rate is lower than Italy's, which, despite a relatively stable rate since 1989, had nonetheless the highest youth unemployment rate in the OECD area at over 30%. Youth unemployment has fallen slightly in the United States and the Netherlands, but the sharpest decrease was in Ireland, where both youth and overall unemployment have declined markedly in the last five years.

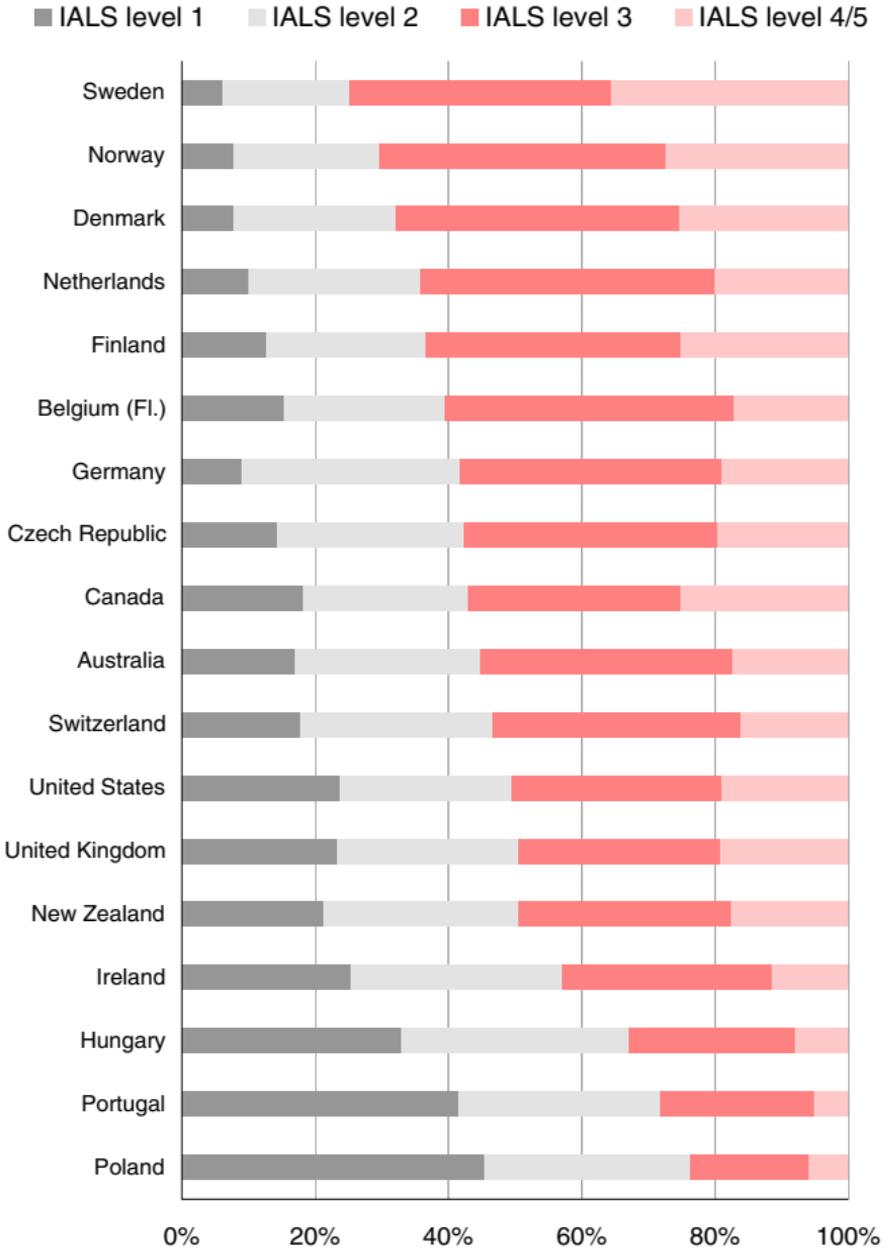

## Students per computer upper secondary education 1998

In the knowledge society, having computers in schools should perhaps be as commonplace as having books, pens and paper. But the distribution of computers in the classroom is uneven across OECD countries. In Norway there were as few as four students per computer in upper secondary school in 1998. That means more time for each student to master information and communications technology. In Canada and the United States there were 6. France, which is considered as a laggard when it comes to PCs in the home, had a healthy ratio in schools, with 8 students per computer. Most of the student tussles to get screen-time would have been in Portugal, where as many as 35 students had to share a computer in 1998. With computer prices generally falling since then, these figures may have improved, though that would also depend on education policies.

## Literacy level

% of population aged 16-65 at each level, 1994-1998

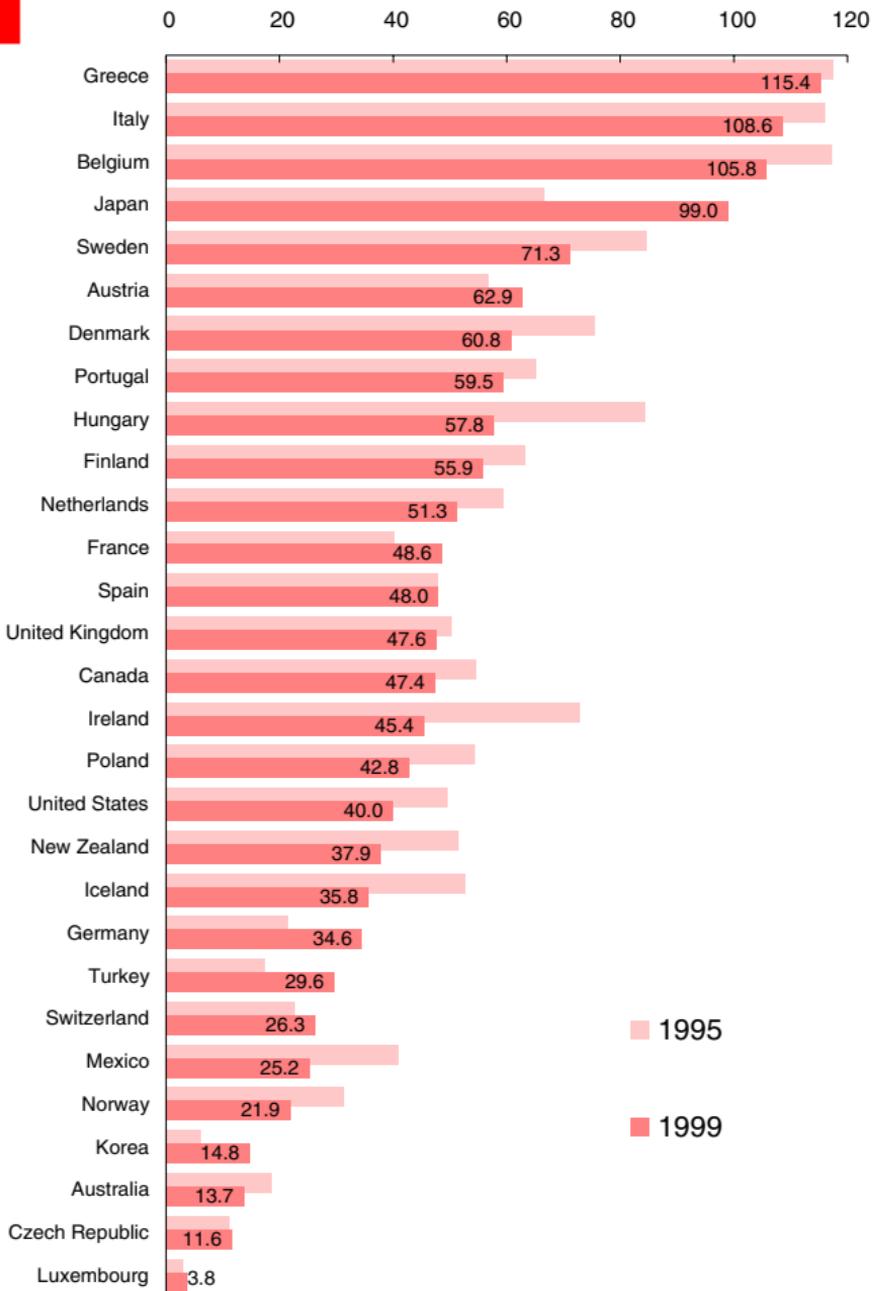

A simple way of assessing human capital is to test people's literacy and other core competencies. The International Adult Literacy Survey (IALS) tested the knowledge and skills required to handle information in various guises, such as official forms, timetables, maps and charts. The chart shows the percentage of adults at each of four main literacy levels, from low (level 1) to high (level 4). Adults on level 3 are generally considered to have the type of skills needed to cope successfully with modern social and economic life. No country did as well as Sweden, and yet, even there, about a quarter of adults fell below this minimum level. In some countries, over half of all adults examined were unable to cope. In Poland, barely over a fifth of those tested managed well enough to qualify for level three or above.

## Life expectancy at birth 1998

One area where gender equality might never be reached is life expectancy. In fact, women can expect to outlive men everywhere, and in some countries by several years. French women born in 1998 can hope to live to around 82, but men would probably only reach 75. Women in Japan had the longest life expectancy at birth, at 84 years. But whereas policymakers may be powerless to change this particular gender gap, the ageing issue does present problems, from a health care and pensions point of view; life expectancy at birth has risen in every OECD country between 1988 and 1998 to the mid-70s in most places (though for Hungarian men there was no improvement; see table page 8).

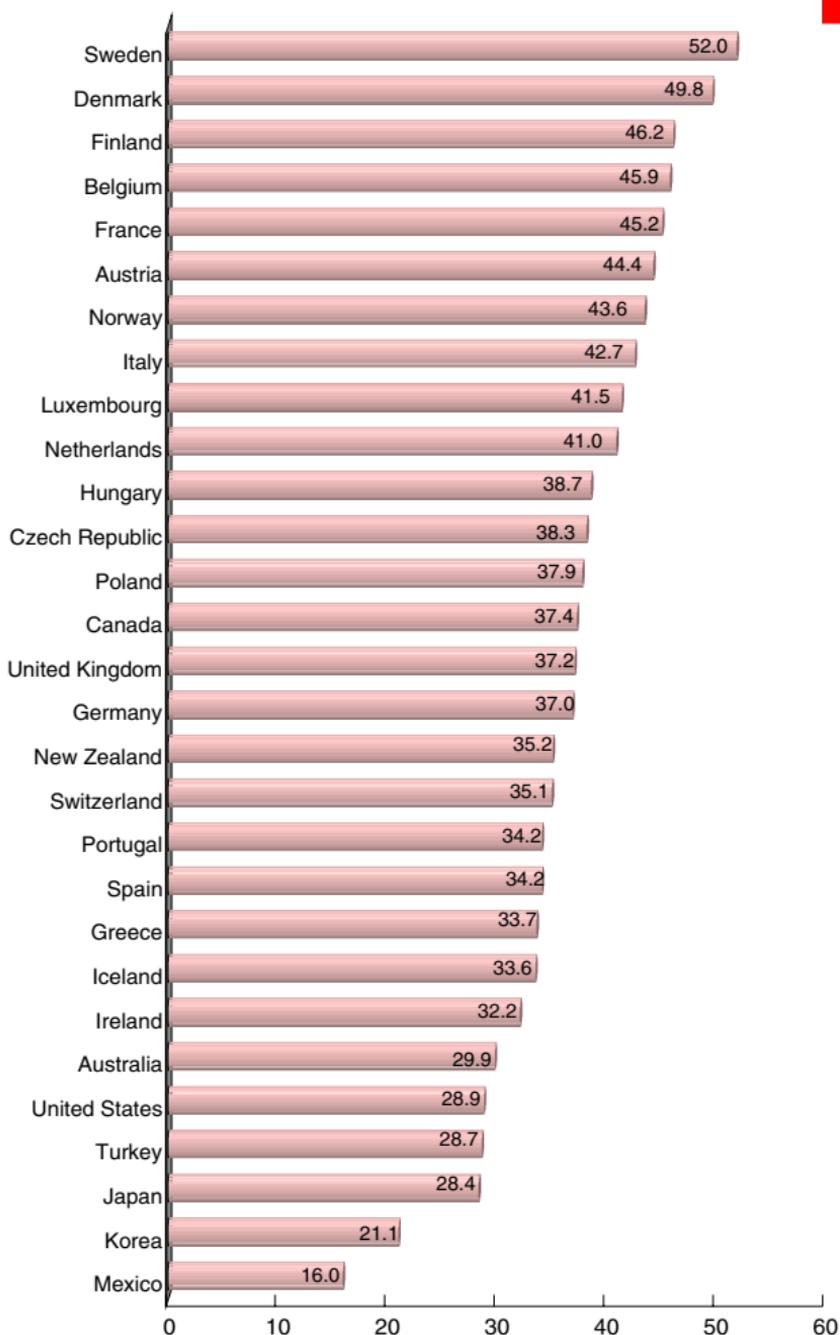

## Central government debt % of GDP

Outstanding central government debt of OECD countries reached a record of about US\$13.7 trillion in 1999, representing an increase of 7% from 1998 and almost double the level of 1990 which stood at US \$ 7.3 trillion. But as a percentage of GDP central government debt has fallen in most countries, key exceptions being Japan and Germany. In fact, throughout the 1990s, on average, the European Union countries, Japan and the United States accounted for more than 90% of total central government debt among the OECD countries. Around 70% of borrowing requirements were financed through marketable debt instruments. Most of the funds were raised in government bonds, as the share of money market instruments declined steadily from 27% of marketable debt instruments in 1992 to 20% in 1999. This reflects measures taken to strengthen the role of market principles in government debt management by improving primary and secondary market arrangements.

## Tax burdens

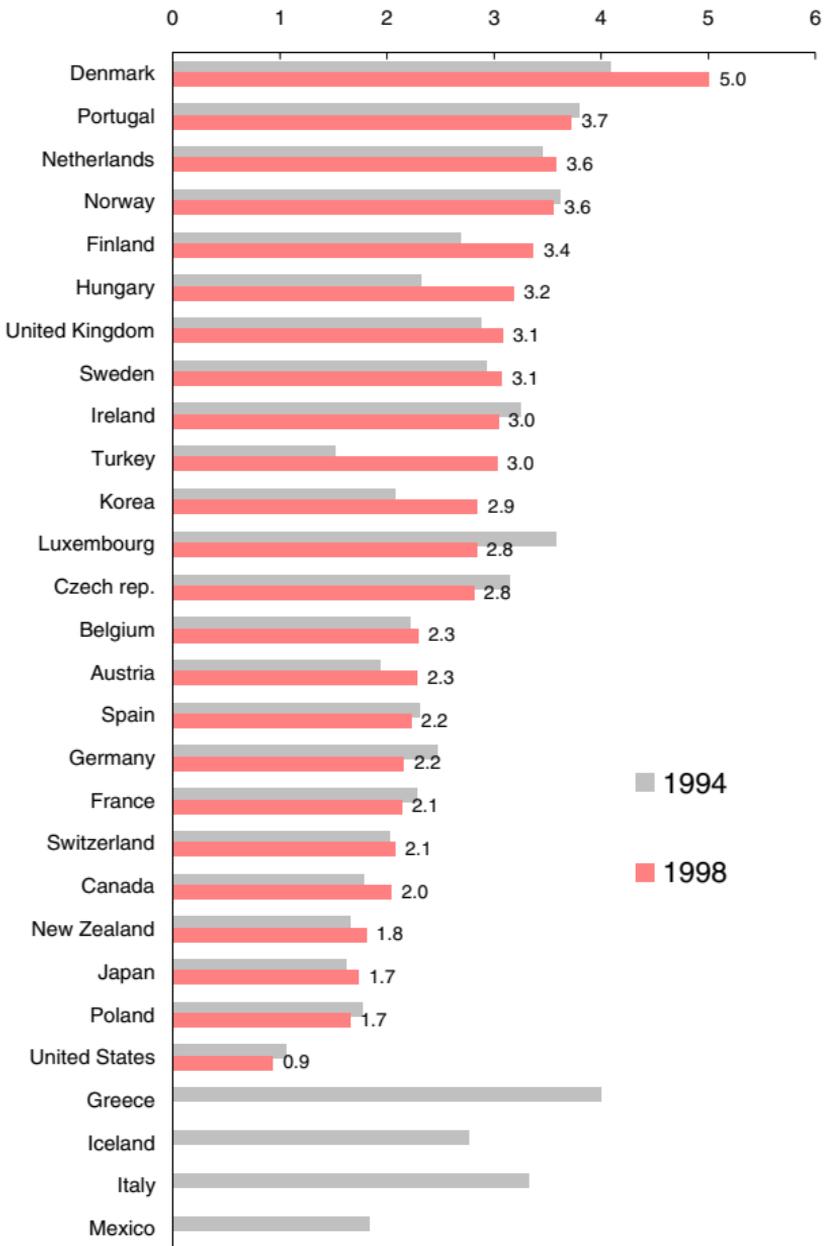

Total receipts, % of GDP  
1998

Mexicans have the lowest tax burden in the OECD, with tax revenue accounting for just 16% of gross domestic product – the only OECD country where the level is below 20%. Sweden has the highest tax burden, at 52% of GDP in 1998, the only OECD country to pass the 50% mark. The tax level is more than 40% in 10 OECD countries, and below 30% in just six, with the United States and Turkey virtually neck and neck at 28.9% and 28.7% respectively. France has the heaviest taxes among the G7 countries, at 45.2% of GDP, while Japan has the lowest at 28.4%.

## Green taxes

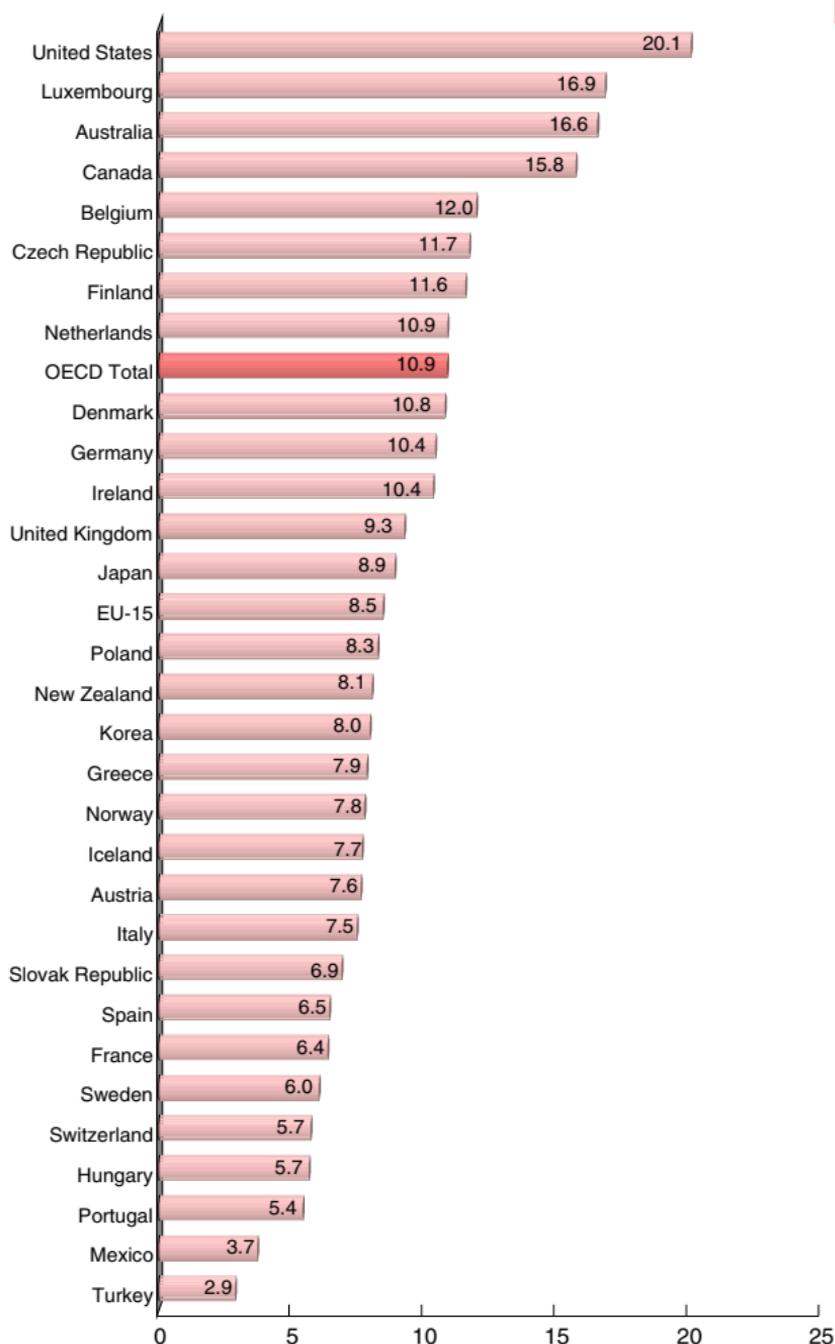

% of GDP

One way of keeping pollution down is to price it. Governments can establish a direct link between environmental degradation and those who cause it by imposing environmentally-related, or green, taxes, whether it be on fossil fuels to discourage their use or a landfill tax on waste disposal. Not all such taxes are deliberately green; raising VAT on petrol has an environmental effect, but the intention may simply be to raise revenue. Still, estimates suggest that a 10% increase in energy prices would reduce energy use by 5% in the long term. Denmark's "green" taxes accounted for 5% of GDP in 1998, up from little more than 4% in 1994, but while Turkey more than doubled its green tax level to more than 3% of GDP over the four years, the United States, Germany and France actually reduced their green tax ratio. On average, OECD environmentally-related taxes came to about 2.7% of GDP in 1998 and 7.2% of the total tax take.

## CO<sub>2</sub> emissions

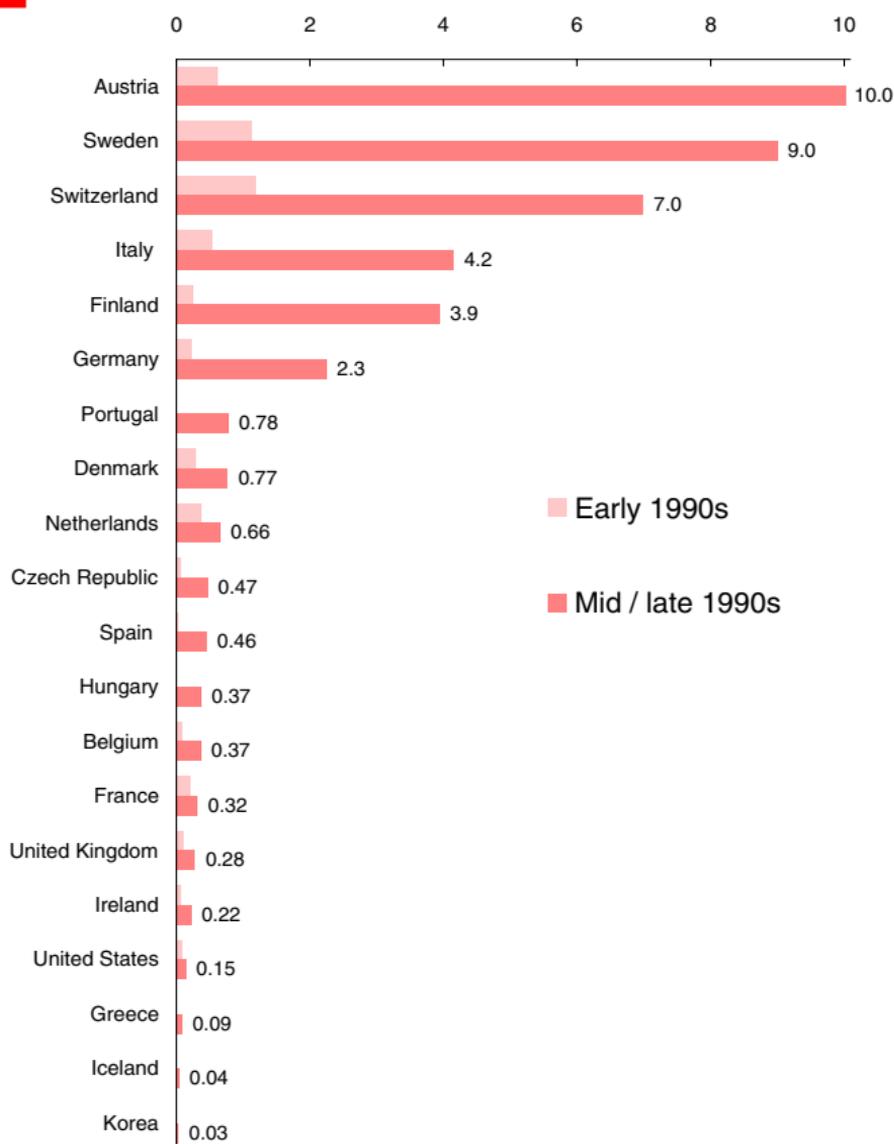

tonnes per capita, 1998

The United States leads the industrial world when it comes to carbon dioxide emissions, at 20.1 tonnes per inhabitant in 1998, almost double the overall OECD level of 10.9 tonnes per head. The European Union, by contrast, produced less than half that amount, as did Japan. Among the G7 industrial countries, only Canada and the United States have emissions above the overall OECD level, while France claims the distinction of the lowest CO<sub>2</sub> emissions per head, at 6.4 tonnes. Turkey produces the least carbon dioxide per head in the OECD at just 2.9 tonnes. The OECD's newest member, the Slovak Republic, produces more CO<sub>2</sub> than France, at 6.9 tonnes per head, but less than Italy's 7.5 tonnes per head.

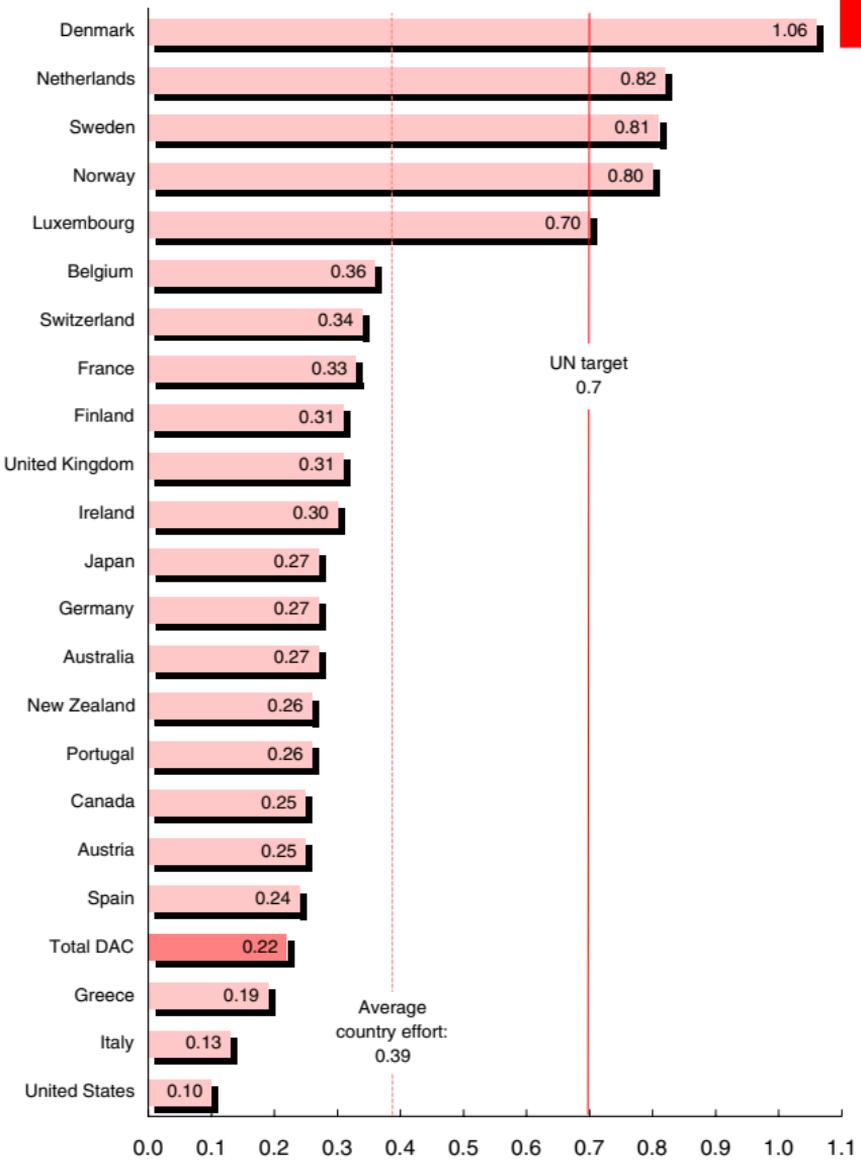

## Organic farming

% of the total agricultural area

The share of agricultural land under organic farming has increased significantly over the past ten years. But while several countries actively encourage conversion to organic farming through subsidies, its coverage remains fairly small compared with agriculture under other farming systems. As the large empty spaces in our chart reflect, organic farming represents less than 1% of total farming area in most OECD countries. There has been some fast growth, in Austria and Sweden for instance; among the G7 countries, organic farming has risen the most in Germany and Italy. One attraction of organic farming is that it reduces some environmental pressures, notably from polluting chemicals. But if it is to match 'conventional' production levels, a significant expansion of the organic farming area would be needed. This could reduce biodiversity if additional natural land were brought into production compared with current needs.

## Development aid net ODA, % of GNP, 2000

Official Development Assistance by Members of the OECD's Development Assistance Committee (DAC) fell by 1.6% in real terms in 2000. As a proportion of DAC members combined GNP this represents 0.22% - a return to its lowest level ever, as first recorded in 1997. Total net ODA flows declined from \$56.4 billion in 1999 to \$53.1 billion in 2000. Were it not for changes in the list of countries eligible to receive ODA (see [www.oecd.org/dac/html/daclist.htm](http://www.oecd.org/dac/html/daclist.htm)), total ODA would have fallen by just 0.2% in real terms.

Fifteen of the 22 DAC member countries reported a real rise in ODA. Only Denmark, Luxembourg, the Netherlands, Norway and Sweden met the UN target of 0.7% of GNP. No other countries exceeded the average effort of 0.39% of GNP. In fact, total aid by G7 countries fell by 4.8% in real terms. This reflects falls from Canada, France, Italy and Japan. There was a real rise of 35.6% from the UK, of 5.9% from Germany and 2.7% from the United States.
