

Slovenia

Ensuring equal opportunities for students across socio-economic backgrounds

- Socio-economic status may significantly impact students' participation in education, particularly at levels of education that rely, in many countries, most heavily on private expenditure, such as early childhood education and care and tertiary education. In Slovenia, private sources accounted for 23% of total expenditure in pre-primary institutions, higher than the OECD average of 17%. At tertiary level, 11% of expenditure comes from private sources in Slovenia, compared to 30% on average across OECD countries.
- Across most OECD countries, socio-economic status influences learning outcomes more than gender and immigrant status. In Slovenia, the proportion of children from the bottom quartile of the PISA index of economic, social and cultural status (ESCS) achieving at least PISA level 2 in reading in 2018 was 21% lower than that of children from the top ESCS quartile, a smaller share than the OECD average of 29%.
- Large differences in educational attainment may lead to starker earnings inequality in many countries. In Slovenia, all 25-64 year-old adults with below upper secondary attainment earned more than half the median earning in 2019, compared to 73% on average across OECD countries.

Gender inequalities in education and outcomes

- In Slovenia, 0.9% of students in lower secondary and 1.3% in upper secondary initial education repeated a grade in 2019, compared to 1.9% and 3% respectively on average across OECD countries. Boys are more likely to repeat a grade at lower secondary initial education than girls. In Slovenia, 63% of repeaters at lower secondary level were boys, higher than the OECD average of 61%. At upper secondary level, the share of boys repeating a grade in Slovenia decreases to 50%, compared to 57% on average across OECD countries.
- Men are more likely than women to pursue a vocational track at upper secondary level in most OECD countries. This is also the case in Slovenia, where 56% of upper secondary vocational graduates in 2019 were men (compared to the OECD average of 55%). Women are generally more likely to graduate from upper secondary general programmes. This is also the case in Slovenia, where women represent 61% of graduates from upper secondary general programmes, compared to 55% on average across OECD countries (Figure 1).
- Tertiary education has been expanding in the last decades, and, in 2020, 25-34 year-old women were more likely than men to achieve tertiary education in all OECD countries. In Slovenia, 57% of 25-34 year-old women had a tertiary qualification in 2020 compared to 36% of their male peers, while on average across OECD countries the shares were 52% among young women and 39% among young men.
- Gender differences in the distribution of tertiary entrants across fields of study are significant. Women tend to be under-represented in certain fields of science, technology, engineering and

mathematics (STEM) across most OECD countries. On average, 26% of new entrants in engineering, manufacturing and construction and 20% in information and communication technologies were women in 2019. In Slovenia, women represented 23% of new entrants in engineering, manufacturing and construction programmes and 16% in information and communication technologies. In contrast, they represented 86% of new entrants to the field of education, a sector traditionally dominated by women. In Slovenia, men represent 22% of teachers across all levels of education, compared to 30% on average across OECD countries.

- Young women are less likely to be employed than young men, particularly those with lower levels of education. Only 42% of 25-34 year-old women with below upper secondary attainment were employed in 2020 compared to 62% of men in Slovenia. This gender difference is smaller than the average across OECD countries, where 43% of women and 69% of men with below upper secondary attainment are employed.
- In nearly all OECD countries and at all levels of educational attainment, 25-64 year-old women earn less than their male peers: their earnings correspond to 76%-78% of men's earnings on average across OECD countries. This proportion varies more across educational attainment levels within countries than on average across OECD countries. Compared to other education levels, women with tertiary education in Slovenia have the lowest earnings relative to men with a similar education level, earning 83% as much, while those with upper secondary or post-secondary non-tertiary education earn 86% as much.
- On average across OECD countries with available data, 25-64 year-old women tend to participate slightly more in adult learning than men of the same age. In Slovenia, 48% of women participated in formal and/or non-formal education and training in 2016, compared to 44% of men. Family reasons were reported as barriers to participation in formal and/or non-formal education and training by 31% of women compared to 27% of men.

Figure 1. Share of women among upper secondary graduates, by programme orientation (2019)

In per cent

1. Includes post-secondary non-tertiary level.

Countries are ranked in descending order of the share of women in general programmes.

Source: OECD (2021). Table B3.1. See Source section for more information and Annex 3 for notes (https://www.oecd.org/education/education-at-a-glance/EAG2021_Annex3_ChapterB.pdf).

Education and migration background

- On average across the OECD, foreign-born adults (25-64 year-olds) account for 22% of all adults with below upper secondary attainment, 14% of those attaining upper secondary or post-secondary non-tertiary attainment, and 18% of tertiary-educated adults. In Slovenia as in most OECD countries, the share of foreign-born adults among all adults with a given level of educational attainment is the highest among adults with below upper secondary attainment (25%) in 2020.
- Foreign-born adults have more difficulty finding a job than their native-born peers as they face various challenges, such as discrepancies in credential recognition, skills, and language. Thus, foreign-born workers are likely to have a lower reservation wage (the lowest wage rate at which a worker would be willing to accept a particular type of job). As a result, the employment rate for foreign-born adults with low educational attainment is higher than the rate for their native-born peers in many countries. On average across OECD countries, among adults without upper secondary attainment, 57% of native-born adults are employed compared to 61% of foreign-born adults. In Slovenia, the employment rate of foreign-born adults without upper secondary attainment was 54% in 2020, higher than that of their native-born peers (46%).
- The likelihood of being employed increases with the level of educational attainment, but foreign-born adults with tertiary attainment generally have lower employment prospects than their native-born peers. On average across OECD countries, 86% of native-born tertiary-educated adults are employed compared to 79% for foreign-born tertiary-educated adults. In Slovenia, among tertiary-educated adults, 91% of native-born adults and 86% of foreign-born adults are

employed. Foreign-born adults who arrived in the country at an early age have spent some years in their host country's education system and gained nationally recognised credentials. As a result, their labour-market outcomes are generally better than that of those who arrived at a later age with a foreign qualification. In Slovenia, among foreign-born adults with tertiary attainment, 91% of those who arrived by the age of 15 are employed, compared to 84% of those who arrived in the country at age 16 or later.

- Foreign-born young adults (15-29 year-olds) are also more likely to be neither employed nor in education or training (NEET) than native-born young adults. On average across OECD countries, 18.8% of foreign-born and 13.7% of native-born adults are NEET. In Slovenia, the difference is 9 percentage points (17.1% compared to 8.3%). Early arrival in the country is generally associated with a lower risk of becoming NEET. In Slovenia, the share of NEETs among foreign-born young adults who arrived by the age of 15 is 2%, while the share of NEETs among those who arrived at age 16 or later is 29%.
- In many OECD countries, foreign-born adults earn less than native-born adults. This pay gap may narrow with higher levels of educational attainment. On average across OECD countries, foreign-born adults with below secondary attainment working full-time earn 89% as much as their native-born peers, while this gap disappears among tertiary-educated adults. In Slovenia, in 2019, among adults with below upper secondary attainment, the earnings of foreign-born full-time workers represented 91% that of their native-born peers, 87% among adults with upper secondary or post-secondary non-tertiary attainment, and 105% among those with a tertiary-education.

Cross-regional disparities in education

- National level data often hide important regional inequalities in children's access and participation to education. In general, inequalities across regions tend to widen at non-compulsory levels of education. For example, in the majority of countries, the variation in enrolment rate of 3-5 year-olds is often greater than the variation among 6-14 year-olds. This is the case in Slovenia, where the enrolment rate of 3-5 year-olds varies from 91% in the region of Eastern Slovenia to 94% in the region of Western Slovenia whereas the enrolment of 6-14 year-olds is 99% in both regions. Similarly, the enrolment rate of 15-19 year-olds varies from 85% to 100% in Slovenia.
- Tertiary attainment may vary significantly within a country. In Slovenia, the share of 25-64 year-old adults with tertiary education varies from 31% in the region of Eastern Slovenia to 42% in the region of Western Slovenia, one of the lowest regional variations across OECD countries with available data.
- On average across OECD and partner countries with subnational data on labour-force status, there is more regional variation in employment rates among those with below upper secondary education (17 percentage points) than for those with tertiary education (8 percentage points). In Slovenia, there is a difference of 8 percentage points in the employment rate of adults with below upper secondary education between different regions of the country compared to 1 percentage point for tertiary-educated adults.
- The proportion of young people who are NEET shows significant subnational as well as national variation across OECD and partner countries. In Slovenia, the share of 18-24 year-old NEETs in the Eastern region is 4 percentage points higher than in the Western region.

COVID-19: 18 months into the pandemic

- The spread of COVID-19 has continued to impede access to in-person education in many countries around the world in 2021. By mid-May 2021, 37 OECD and partner countries had experienced periods of full school closure since the start of 2020.
- The number of instructional days when schools were fully closed since the start of 2020 due to the pandemic (excluding school holidays, public holidays and weekends) varies significantly between countries and increases with the level of education. Slovenia follows this pattern. In Slovenia, pre-primary schools were fully closed for an average of 102 days between 1 January 2020 and 20 May 2021. Meanwhile primary schools closed for 94 days, lower secondary for 118 days and upper secondary general schools for 118 days. In comparison, respective closures were 55, 78, 92 and 101 days on average across the OECD.
- In many countries, schools did not fully close but remained open with reduced capacity. Schools at upper secondary (general) level in Slovenia for instance experienced 70 days of partial opening between January 2020 and May 2021, 27 of which occurred in 2020 and 43 in 2021. In total, this was higher than the number of days of partial opening in the OECD on average (57 days), where there were 27 days of partially open instruction in 2020, and 30 days in 2021. When adding both the number of days where schools were fully and partially closed, learning in upper secondary general education was disrupted by 188 days in Slovenia between January 2020 and May 2021.
- During periods of full school closure in 2020, 21 OECD and partner countries have opted to keep upper secondary general schools virtually open as a national level strategy, including Slovenia. However, in 4 countries, excluding Slovenia, each day of remote learning was not considered equivalent to a full day of in-person instruction. The way that online platforms have operated during school closures has varied between countries. In Slovenia, a hybrid approach was adopted for educational levels from primary to upper secondary, including a blend of both asynchronous and synchronous online learning.
- The impact of COVID-19 and school closures on educational equity has been a concern for many countries. 30 out of the 36 OECD and partner countries surveyed, including Slovenia, declared that additional measures were taken to support the education of children who might face additional barriers to learning during the pandemic. 22 of these countries, including Slovenia, stated that they had subsidised devices for students to help them access education. Measures to encourage disadvantaged or vulnerable students to return to school after closures were also implemented in 29 OECD and partner countries, including in Slovenia.
- Countries have faced difficult decisions on how to best manage their resources to ensure that students can continue to access quality education in the safest possible conditions and to minimise disruption to learning. Before the pandemic, total public expenditure on primary, secondary and post-secondary non-tertiary education in Slovenia reached 3.1% of gross domestic product (GDP) in 2018, which was lower than the OECD average of 3.2%. About two-thirds of OECD and partner countries reported increases in the funding allocated to primary and secondary schools to help them cope with the crisis in 2020. Compared to the previous year, Slovenia reported an increase in the fiscal year education budget for primary and lower secondary general education in both 2020 and 2021.
- 20 OECD and partner countries, including Slovenia, stated that the allocation of additional public funds to support the educational response to the pandemic in primary and secondary schools was based on the number of students or classes. At the same time, 16 countries targeted additional funds at socio-economically disadvantaged students as a way to ensure that resources targeted those that needed them the most, including in Slovenia.
- Countries' approach to prioritise teachers in vaccination campaigns against COVID-19 has varied. In total, 19 OECD and partner countries, including Slovenia, have prioritised at least some teachers

as part of the government's plans to vaccinate the population on a national level (as of 20 May 2021).

- The impact of the pandemic on the economy has raised concerns about the prospects of young adults, especially those leaving education earlier than others. In Slovenia, the unemployment rate among 25-34 year-olds with below upper secondary attainment was 16.9% in 2020, an increase of 4 percentage points from the previous year. In comparison, the average youth unemployment rate of 15.1% in 2020 across OECD countries represented an increase of 2 percentage points from 2019 (Figure 2).
- At the same time, the number of adults participating in formal and/or non-formal education and training decreased by 27% on average in the OECD between the second quarter of 2019 and the second quarter of 2020 (i.e. during the peak of the first wave of COVID-19 in many OECD countries). In Slovenia, the participation of adults in formal and/or non-formal education and training in this period decreased by 55% in Slovenia.
- Despite the impact of the crisis on employment, the share of NEETs among 18-24 year-olds did not greatly increase in most OECD and partner countries during the first year of the COVID-19 pandemic. On average, the share of 18-24 year-old NEETs in OECD countries rose from 14.4% in 2019 to 16.1% in 2020. In Slovenia, the share of 18-24 year-old NEETs was 9.6% in 2019, which increased to 10.6% in 2020.

Figure 2. Trends in unemployment rates of 25-34 year-olds with below upper secondary attainment (2019 and 2020)

In per cent

Source: OECD (2021), Table A3.3. See Source section for more information and Annex 3 for notes (https://www.oecd.org/education/education-at-a-glance/EAG2021_Annex3_ChapterA.pdf).

Investing in education

- Annual expenditure per student on educational institutions provides an indication of the investment countries make on each student. After accounting for public-to-private transfers, public expenditure on primary to tertiary educational institutions per full-time student in Slovenia was USD 9 211 in 2018 (in equivalent USD converted using PPPs for GDP) compared to USD 10 000 on average across OECD countries.
- The provision of education across public and private institutions influences the allocation of resources between levels of education and types of institution. In 2018, Slovenia spent USD 9 584 per student at primary, secondary and post-secondary non-tertiary education, USD 870 lower than the OECD average of USD 10 454. At tertiary level, Slovenia invested USD 14 060 per student, USD 3 005 less than the OECD average. Expenditure per student on public educational institutions is higher than on private institutions on average across OECD countries. This is also the case in Slovenia, where total expenditure on primary to tertiary public institutions amounts to USD 10 520 per student, compared to USD 6 861 on private institutions.
- Between 2012 and 2018, expenditure per student from primary to tertiary education increased at an average annual growth rate of 1.6% across OECD countries. In Slovenia, expenditure on educational institutions grew at an average annual rate of 0.2%, while the number of students grew on average by 0.3% per year over this period. This resulted in an average annual growth rate of - 0.1% in expenditure per student over this period.
- The share of national wealth devoted to educational institutions is lower in Slovenia than on average among OECD countries. In 2018, Slovenia spent 4.2% of its GDP on primary to tertiary educational institutions, which is 0.7 percentage points lower than the OECD average. Across levels of education, Slovenia devoted a lower share of GDP than the OECD average at both non-tertiary and tertiary levels (Figure 3).
- The share of capital costs on total expenditure on educational institutions is lower than the OECD average at primary to tertiary level in Slovenia. At primary, secondary and post-secondary non-tertiary level, capital costs account for 8% of total spending on educational institutions, similar to the OECD average (8%). At the tertiary level, capital costs represent 8%, lower than the average across OECD countries of 11%.
- Compensation of teachers and other staff employed in educational institutions represents the largest share of current expenditure from primary to tertiary education. In 2018, Slovenia allocated 77% of its current expenditure to staff compensation, compared to 74% on average across OECD countries. Staff compensation tends to make up a smaller share of current expenditure on tertiary institutions due to the higher costs of facilities and equipment at this level. In Slovenia, staff compensation represents 71% of current expenditure on tertiary institutions compared to 79% at non-tertiary levels. On average across OECD countries, the share is 68% at tertiary level and 77% at non-tertiary level.

Working conditions of school teachers

- The salaries of school staff, and in particular teachers and school heads, represent the largest single expenditure in formal education. Their salary levels also have an impact on the attractiveness of the teaching profession. In most OECD countries and economies, statutory salaries of teachers (and school heads) in public educational institutions increase with the level of education they teach, and also with experience. On average, statutory salaries of teachers with maximum qualifications at the top of their salary scales (maximum salaries) were between 86% and 91% higher than those of teachers with the minimum qualifications at the start of their career (minimum salaries) at pre-primary (ISCED 02), primary and general lower and upper secondary levels in 2020. In Slovenia, maximum salaries were 67% to 80% higher than minimum salaries at each level of education (Figure 4). However, most teachers were paid between these minimum and maximum salaries.
- Between 2005 and 2020, the statutory salaries of teachers with 15 years of experience and the most prevalent qualifications increased (at constant prices) by 2% to 3% at primary and general lower and upper secondary levels, on average across OECD countries with data for all reference years, despite a decrease of salaries following the 2008 financial crisis. In Slovenia, teachers' salaries at these levels increased by 7%.
- Teachers' actual salaries reflect their statutory salaries and additional work-related payments. Average actual salaries also depend on the characteristics of the teaching population such as their

age, level of experience and qualification level. In Slovenia, teachers' average actual salaries (after conversion to USD using PPPs for private consumption) amount to USD 33 355 at the pre-primary level (ISCED 02), USD 40 066 at the primary level, USD 41 124 at the general lower secondary level and USD 43 348 at the general upper secondary level. On average across OECD countries, teachers' average actual salaries were USD 40 707, USD 45 687, USD 47 988 and USD 51 749 at the pre-primary, primary, lower secondary and upper secondary level respectively (Figure 4).

- Teachers' average actual salaries remained lower than those of tertiary-educated workers in almost all countries, and at almost all levels of education. Teachers' average actual salaries at pre-primary (ISCED 02), primary and general secondary levels of education were between 81% and 96% of the earnings of tertiary-educated workers on average across OECD countries and economies. In Slovenia, the proportion ranged from 72% to 93% at pre-primary, primary and general secondary levels of education.
- However, there are significant differences between men and women in relative salaries of teachers due to the gender gap in earnings across the labour market (statutory salaries are equal for male and female teachers in public educational institutions). When average actual salaries of teachers are compared to salaries of tertiary educated workers, these relative salaries are usually higher for women, and lower for men. In Slovenia, the proportion ranges from 94% to 102% for women (98% to 110% on average across OECD countries and economies), and from 78% to 83% for men (76% to 85% on average across OECD countries and economies) in primary and general secondary education.
- The average number of teaching hours per year required of a typical teacher in public educational institutions in OECD countries tends to decrease as the level of education increases: it ranged from 989 hours at pre-primary level (ISCED 02), to 791 hours at primary level, 723 hours at lower secondary level (general programmes) and 685 hours at upper secondary level (general programmes) in 2020. In Slovenia, teachers teach 1 314 hours per year at pre-primary level, 627 hours per year at primary level, 627 hours at lower secondary level (general programmes) and 570 hours at upper secondary level (general programmes).
- In primary and secondary education, about 35% of teachers on average across OECD countries will reach retirement age in the next decade, while the size of the school-age population is projected to increase in some countries, putting many governments under pressure to recruit and train new teachers. In 2019, the proportion of teachers in Slovenia aged at least 50 years old was slightly lower than the OECD average and reached 34% in 2019.

Figure 4. Lower secondary teachers' average actual salaries compared to the statutory starting and top of the scale salaries (2020)

Annual statutory salaries of teachers in public institutions, in equivalent USD converted using PPPs

Updated data can be found on line at <http://dx.doi.org/10.1787/eag-data-en> and by following the *StatLinks*  under the tables and charts in the publication.

Data on subnational regions for selected indicators are available in the *OECD Regional Statistics* (database) (OECD, 2021). When interpreting the results on subnational entities, readers should take into account that the population size of subnational entities can vary widely within countries. For example, regional variation in enrolment may be influenced by students attending school in a different region from their area of residence, particularly at higher levels of education. Also, regional disparities tend to be higher when more subnational entities are used in the analysis.
