TAXES ON THE AVERAGE WORKER

Taxes on the average worker measures the ratio between the amount of taxes paid by an average single worker without children and the corresponding total labour cost for the employer. This tax wedge measures the extent to which the tax system on labour income discourages employment.

Definition

The taxes included in the measure are personal income taxes, employees' social security contributions and employers' social security contributions. For the few countries that have them, it also includes payroll taxes. The amount of these taxes paid in relation to the employment of one average worker is expressed as a percentage of their labour cost (gross wage plus employers' social security contributions and payroll tax).

An average worker is defined as somebody who earns the average income of full-time workers of the country concerned in Sectors B-N of the International Standard Industrial Classification (ISIC Rev. 4). The average worker is single, meaning that he or she does not receive any tax relief in respect of a spouse, unmarried partner or child.

Comparability

The types of taxes included in the measure are fully comparable across countries. They are based on common definitions agreed by all OECD countries and published in OECD Revenue Statistics.

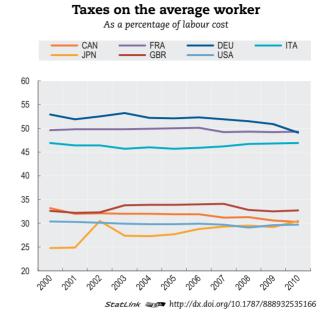

While the income levels of workers in Sectors B-N differ across countries, they can be regarded as corresponding to comparable types of work in each country.

The information on the average worker's income level is supplied by the Ministries of Finance in all OECD countries and is based on national statistical surveys. The amount of taxes paid by the single worker is calculated by applying the tax laws in each country. These tax wedge measures are therefore derived from a modelling exercise rather than from the direct observation of taxes actually paid by workers and their employers.

Overview

In 2010, taxes on an average worker, on average, represented around 35% of their total labour costs across OECD countries. This tax wedge ranged between 7% in Chile and 55% in Belgium.

On average, taxes on an average worker for the OECD as a whole have decreased by nearly two percentage points since 2000. However, there are important differences between countries. Of the 34 OECD member countries, 9 countries experienced an overall increase in the taxes on an average worker since 2000. The countries with the largest increases were Iceland and Japan. Of the 23 countries that have experienced an overall decline, the largest decreases were for Hungary, Israel and Sweden.
